Got a four wheel drive?

In the past, I have just chained a wide crowbar to the hitch, at a low point on the bar, held it up-right and had the wife idle forward in the line I had for the coax. Two/three passes got me the depth I wished ... some cleaning of the trench was done after ... easiest I have found. Have used this for radials also ... but, would NOT be suited for ones small yard.

However, in very rocky soil I wonder how well it would work?

I have tried this. It worked ok for smaller RG6-sized cable for my
beverages. It was fairly time-consuming and not that easy to do. The
slot cut by the edger I have is too narrow to bury RG8 sized cable easily
however.

==========
Apart from with which equipment you bury the coax cables ,I would
recommend that you run the cables inside plastic (polyethylene) water
pipe instead of allowing the cables to be buried directly .You then can
use 'normal' coax including the 75 Ohms stuff used for satellite TV dish.
Where the pipe with cables come out of the ground make a 180 degree bend
such that the open end points downwards ,avoiding water ingress while
keeping an open vent preventing condensation inside the plastic pipe.

The plastic pipe also provides mechanical protection .

I installed a TV satellite dish in the garden running the coax
underground as per the above .
That was 16 years ago ....never had a problem !

I've already stated that I'm getting the filters.

There is an electronics specialty store close by that carries all
sizes and range in price from 50 cents to a $1.50.

Thanx Jim.

Exactly. If this proves anything, it proves that those who are not worried about stepping out into the sun, but fear exposure to their cell phone, they will always be worried about their cell phones.

Let's approach this from first principles. The battery in the phone is the only source of power. My own as an example has by the manufacturers rating -
From Nokia for their 6263 model:
BL-5C 1020 mAh Capacity;
Talk time GSM up to 3 hours 20 min;
Stand-by GSM up to 11.25 days
Dump that capacity at a potential of 3.6V for the full talk time after a fresh charge gives us 1.10 W PER HOUR.

Put 3 1/2W 51 Ohm resistors into a series circuit across the terminals of a 12V DC Source, hold the resistor pack (less than 1cMï¿½) against the skin (I used my earlobe) and you have a literal tissue test under the full power capacity of the battery as used continuously in a Nokia 6263 EXCEPT 100% of that power is lost to heat entirely - nothing towards the display, nothing towards the RF, nothing towards the speaker, nothing towards the microprocessor, etc. ALL of the heat is confined with nothing towards the greater mass of tissues in the CNS.

What is the temperature rise? As measured using a fever thermometer on the opposite side of the lobe: from 98.0ï¿½F to 99.4ï¿½F for 11.82V @0.0778A after several minutes. Cut the blood flow by tightly griping the lobe/pack/thermometer, and you can push this up another 6ï¿½F. As Jim offers in his last comment, blood flow makes all the difference (unless the creationists are worried about the tumor inducing effects on corpses).

You have to first ask yourself, how to make the RF "grip" the tissue to lower blood flow to raise temperature.

Next you have to ask how to make the RF ignore the mass of tissue. An ear lobe is highly insulated from the heat absorbing bulk of the skull. Ask any creationist why God chose large ears for animals that have to shed heat that can't escape their fur covered bodies.

Next you have to ask how to make the Total conversion of battery power into RF (lossless, perfect source) available for total, selective absorption in the tissue.

All questions above are for the worriers to dwell upon and to conspire to fulfill through creationist scienz (ironically "blame God" would be their answer). First, 1020mAh is maximum available battery capacity. Other ratings for a replacement battery range as low as around 500-750mAh. You may elevate the earlobe temperature by 1.4ï¿½F - but not for long.

This particular Nokia model operates as high as 2.1GHz (14cM band) and would require an extremely complex antenna (pointed directly into your skull) to focus a beam in a 0.6cMï¿½ cube (1/16th wavelength area within less than a wavelength from the antenna). As the medicos would say:

the application of a directional antenna of these design requirements for a general coverage service is contra-indicated.

Unless someone comes up with other figures (you will need the creationist un-approved full four function calculator), it would seem that nothing less than navel gazing can propel this thread further.

Actually, it's not quite *that* simple..

The simple analysis is just for thermal effects. One has to also ask whether there are significant "athermal" effects. These can come from several potential sources. First, one can consider whether the radiation itself can do anything.. well, the photon energy at microwave frequencies is so low that it's orders of magnitude below any known chemical reaction's activation energy.

Or, one can consider E or H field effects. If the E field is high enough, it can depolarize a neural membrane, for instance, and cause

false neural impulses. That would be an acute effect.

One also needs to consider peak vs average effects. One could probably power a defibrillator from a cellphone battery quite nicely, and that can dump a few hundred joules at just the right time to cause some serious problems. Again, though, that's an acute, not exposure/chronic effect.

Hi Jim,

It IS that simple. The athermal effects you describe such as "photon
energy" is a temperature so low that for all practical purposes could
be called absolute zero. No one has suggested frost-bite induction as
a source of CNS trauma. Besides, thermal effects (or athermal) are
related to phononic energy. Phonon-Photon interaction is the
principle you are implying, and besides myself, I doubt anyone could
follow that discussion. Aside from yourself, no one here showed any
capacity to either calculate a temperature rise, or test it at the
bench. This leaves little room for dialog on the matter - hence the
plunge into shamanism.

As for the E field, a 9 volt battery clipped between the ears hardly
suffices, and electroshock therapy goes a further and most obvious
distance. The arguments put forward by those who cry caution beg for
dramatic and catastrophic effects that are unnoticed - a contradiction
on the face of it: an anticonvulsant taser wound without a mark. The
lack of substantive evidence is begged off as being undetectable (the

same contradiction) or too mysterious to have been thought of (which is a vanity statement). My allusion to Phonons would certainly fall into this last category, but it is an old field of established study that is rare, not unknown.

I've calibrated defibrillators and worked with peak energy delivery systems from millijoules to kilojoules. A cell phone does not qualify - not even acute and chronic is several orders of magnitude below that. Every thing about the design conspires against it.

Better way!

Borrow a couple of cymbols from someone (large concave disks). Remove
wheel from wheel barrow. Bolt cymbols together in place of the
wheel. Fill wheel barrow with required amount of weight for deep
enough trench. Have wife push it where the trench needs to go. Stamp
down sides of trench after laying cables. Easy! Oh, return cymbols
after cleaning. Good luck about the 'wife' part! (Tell'em it builds
particular sets of muscles groups, that ought'a help?)

Really? You are kidding me, or else you don't know what you are talking about, again, right? I mean, this is the best apple & oranges comparison I have ever seen done by an IQ-challenged person!

Ghz cell phones, which cause a oscillations (indeed, complete turn-abouts of the water molecules) ~one-billion times per/sec is a good comparison to light? Who said that, the wizard of oz?

You idiot ... such oscillations cause actual changes in the cell walls of food being cooked which can be observed ... google is your friend wizard richard ... what was your title again? Excellent kiss-a$$ to the real experts? "One who stands in the shadow of the big guys hoping something will rub off?"

I should think, "Brown-Noser-Wannabe" pretty much sums up the title you deserve, to everyones satisfaction--certainly to mine!

Some differences are that HT conversations tend to be a lot shorter.

I'll bet my XYL spends 4 hours a day on various wireless and cell phones.
I know some who spend more. But they are convenient, they are handy. You
can walk around with them and do other things whil you are doing it. Its
a "big help" in her business.

That's okay, she thinks I'm nuts with my concern for cellphone use also.
Hopefully I'm wrong.....

Bad way to get on someones good side. Usually considered fightin' words.
Some places you can look up the local ham club and ask for help correcting
at your end if you don't point fingers. As for myself and others I was
brought up with, it was standard proceedure to insure cleanliness at our
end, and bend over backward to make sure our neighbors were happy. Things
like this aren't being taught in the seminars, nor is the knowledge getting
through to newer recruits. I also had problems with a neighbor at one point
and described to him exactly how to fix it at his end and due to his
beligerance, he raged for another year before actually taking my advice,
then appologizing and in fact THANKING me for the best TV reception he had
never seen before.

Take the step by step approach. Do away with any antenna Amp if possible
and check for flaky connectors and cables. RG-59 cables should be thrown
out in favor of RG-6 Quad shield for all TV cables including jumpers.

All the the following is your best advise, but I find the snap together type
of ferrites to have marginal results. Use the large Doughnut type that will
allow you to loop the connector through several turns (4-10) for the Speaker
wires and for the TV cable too (but use large loops to avoid kinking) just
before going into the amplifier or stack. This is a good way to tidy up
extra wire. Two or three doughnuts do better if you need extra protection
This keeps the energy from riding along the cable right into the chassis
where unintended bad things happen. With this setup I am able to watch
of-the-air broadcast TV while operating a 500 watt station in the same room.

I haven't bothered with the computer speakers in the next room though. They
pick up the data noise from nearby cellphones but not the ham station... Go
figure!

That was my point restated ever so diligently.

After reading 1/4 of the "Biological studies..." it is interesting. But we need to remember that experiments only become valid when repeated numerous times. As these are only summaries, they are hard to compare and we loose that without having the full experiment laid out before us. I have tended to throw away those that didn't describe the frequency and field strength in some way as less than anecdotal.

I have seen data from a few of the experiments before and further experimentation would be a good thing particularly the ones that seem to describe low levels with certain modulation specifics. Also we need to differentiate the studies that involved 60 Hz AC fields which do seem to have an effect, but again more experimentation is required to try to figure out why some of these experiments conflict.

I have performed an RF evaluation at my station and recommend prudence when operating. I am expected to do this because I am in control of the equipment and can make changes that may result in higher levels of exposure. Those who go out and buy the wireless device are limited by the FCC approval of the whole unit, and battery vs. talk time also limit the potential of exposure and hazard to negligible.

Now as for certain people who equate that with hazards that require the defeating of safety interlocks to prove their point? Cars are dangerous, but most of all, people who run off the road into overpasses to prove the point. God help them.

Real hazards are people trying to expose themselves to exhaust fumes with the vehicle in reverse or in a closed garage or removing the guards from lawn mowers and putting their hand in the blade or electing someone to public office that makes selections on judges, who also pals around with extremists and radicals, including those who hate the country they live in and make death threats on those they hate. You can judge a book by its cover if it is trying to tell you what is inside. Dropping some friends just because you are running for public office says something too. Also it seems to me that those who promote "change" without positive solutions are really seeking to destroy.

So,I trust you are not saying that all effects from these wonderful
devices are thermal?

One of the problems I see is that frankly, there is a tactic being used
here that is strangely reverse related to the old creationist argument
of if A is wrong, or cannot be proven, then B must be the answer.

It isn't. The warming feeling I noted is almst certainly NOT an actual
thermal effect. I've touched my ear when this has happened, and it isn't
a bit warmer to the touch - it only feels warm in my "headspace".Sorry,
couldn't think of any other words to describe it.

I'm possibly nuts (not all that likely) psychosomatic (maybe, but I doubt
it) or maybe there is something happening here.

Hi Mike,

So, you experience it as a burn, it isn't a burn, and it is as serious
as a burn, but it is otherwise inexplicable? Now THAT is an argument
for the books and sure to defy any measure, qualification, or

solution. We may as well speculate that if you fall out of bed while dreaming of plunging off a cliff, then you die when you strike the floor.

This is called an anecdotal report - and the Bible is full of them. Unfortunately, theologians don't really argue the Bible, they argue religion which has some very rigorous protocols. I don't see any protocols observed in the anecdote and is one reason why the Vatican rarely admits new miracles.

If it worried you as a real problem, you would probably stop it. This is a common protocol that needs no authorization from the Pope. If you don't stop, then perhaps you might want to re-evaluate the diagnosis of being nuts (avoiding a real problem is NOT psychosomatic).

If it doesn't worry you as a real problem, this is simply navel gazing and still does not rise to psychosomatic. That's OK too, because hard science has already finished off the substance of the issue. If you want the science behind the "perception." I would offer that it is only remotely associated with Physics as initiator, and backfilled with the Ape's reflex of drawing away from the fire (the scienz of psychology that you anticipate above).

Thus it devolves to the allowance that, yes, perhaps you might catch fire if you used your cell phone in your sleep. That should spawn traffic in yet another side thread that arcs away from antennas.

I also did a successful cable run inside plastic pipe. I used PVC 20 years
ago and not a problem since.

Some cable is advertised for "Direct Burial" but, based on the amount of
foot traffic over the area, I elected to use the pipe for the mechanical
protection. Pulling the cable was a tough job because I underestimated the
size pipe I needed. I finally had to cut the pipe and pull the cables in in
two sessions. I included a union in my final pull and cemented the halves
together before filling in the ditch.

I applied similar calculations to a jalepeno pepper I ate today. I took it out of the refrigerator in which it had stabilized at around 35 degrees. Popped it in my mouth and munched away. The pepper made my mouth hot and it burned pretty good.

It isn't possible to do that. Given that the pepper was at 35 degrees, it in fact should have lowered the temperature in my mouth temporarily until blood flow could compensate.

Further inspection showed that there were no apparent blisters or unusual redness in my mouth after eating the pepper, so the only conclusion I can make is that the sensation I felt, I did not feel.

It's a warming sensation

>> and it is as serious as a burn,

I don't know if is a serious matter or not. I just report it. I'm not the only one

> This is called an anecdotal report - and the Bible is full of them.

C'mon, Richard. It follows then that cell phone use is proscribed by the bible? At least according to the local Amish Bishops...

The last statement was nonsense, ant the quote it replied to wasn't much above it.

I broke my ankle a few years back. It hurt like hell. Of course that's anecdotal too. 8^)

> If it worried you as a real problem, you would probably stop it. This

I have to carry a cell as part of my work. My average call is less than a minute. I use it as little as possible.

> If it doesn't worry you as a real problem, this is simply navel gazing
> and still does not rise to psychosomatic. That's OK too, because hard

For a very narrow issue. One that is not related to what I am looking at.

> Thus it devolves to the allowance that, yes, perhaps you might catch
> fire if you used your cell phone in your sleep. That should spawn
> traffic in yet another side thread that arcs away from antennas.

From the sublime to....

Does it follow then that since I'm not at all likely to spontaneously combust due to my cell phone use, that there are no effects?

And to think I had some hope that this might turn into a productive discussion.

I'm still not convinced that use of tobacco products are bad for you,
and I've got scientific evidence from tobacco industry lawyers to back
me up. ;^) No relation to this issue except there are people who stand
to profit by both being harmless.

There is always the question of how many studies it takes to make
something "real". I always like to mention the book from the 1870's that
mentions how smoking causes lung cancer; chewing causes oral cancer. But
it wasn't until almost a hundred years later that it really did, because
it took that long to be "proven".

All we can do is make an informed guess, and stick with it. I choose to
limit my cell phone use.

> You have no idea about how the conversation transpired.

He knows enough that you told the neighbor he was broadcasting
illegally. Just like you said.

So okay. Do you want to solve the problem, or do you want to be one of
the stories on Dateline some evening? About the two nieghbors who
couldn't get along, and it escalated into something much worse...
Perhaps it isn't important for you to get along with your neighbors, but
you made it a lot harder to fix the problem.

If this person is a Ham and operating legally, it's your responsibility.
In most cases the Ham is really happy to help, because in most cases,
they just want to be a good neighbor. Oh, but wait, you already poisoned
the waters. After all, He's doing this illegally, eh?

On the other hand, if he is a CB'er using illegal power, you have a
whole lot more leverage. You can turn him in to the F.C.C. and they can
take care of the matter. But wait! He knows exactly who turned him in,
doesn't he?

But your attitude here in the group, where people are actually trying to
help you, indicates that you might be just as worried about "being
right" as you are about having the problem fixed. People try to give
good advice, and you get p***d off at them. Have fun!

Hi Mike,

Not likely? This "certitude" falls into the same category of
speculation that began this side thread. The rhetoric of "not likely"
automatically admits it into having the same small possibility of cell
phone tumor risk.

In the loose, dataless environment of this debate, spontaneous
combustion from the use of a cell phone is now a reality supported by
dialog. That it is a fiction is overwhelmed by it inhabiting debate
about real worry.

Of course I introduced this tar-baby and it worked. There is no way
to back out of its grip without data now.

What is really going to "cook your noodle" is when you realize this is how cigarette smoking was determined to actually be good for you. Remember the old ads with doctors, of actors who looked like doctors, telling how studies had actually determined smoking improved/enhanced your health?

Now class, can you find any examples of this/these "disinformation methods" still in use today? Any suspected examples?

Let's see, if one were to take a cubic inch block of dry air-chilled sodium straight out of the fridge and dump it into a bath tub with 4 orders of more magnitude volume of water, no heat should be possible because of the massive heat sink of that water at room temperature and that same cold block of material. The same could be said of Phosphorous going in the reverse direction.

No bang would be heard, if you weren't there to hear it.

You willing to witness this test (sodium or phosphorous) to confirm the supposition? Take a bigger bite of an apple size Chipotle and report about the absence of blistering instead.

Better yet, can you prove that the jalapenos don't lead to CNS tumors. Are you willing to accept the responsibility for your stand that they don't.

Admittedly, this is the first time that I have heard "not likely"
turned into certitude. I would at one time have said that wasn't very
likely.

One might begin to think that there is bit of a difference between
scientific discourse and English discourse. That is likely. Whereas I
highly doubt that it would happen, you use that doubt as a springboard
to add to the issue.

All without answering my question!

I doubt that using a cell phone wil cause me to crave lutefisk either.
So we add another possibility to the mix.

Ask a scientist if a singularity might show up and start spitting to
coffee cups S/he will probably say "not likely", when indeed it is
almost impossible, yet not eliminated. Something like almost infinitely
unlikely, depending on if we ascribe to the big crunch eventually
following the big bang, or even the big cigarette. But at least take a
shower. But I digress.....

It doesn't ipso fatso mean they accept that as a real possibility. But
the odds, as scientists look at them, make it difficult to state 100
percent yes or no. We see it all the time on TV cop shows when they go
to court. They even give odds on DNA evidence.

Now onto the concept of spontaneous human composting er combustion....

See how this grows? We are now engaged in debating what is "not
likely," but of course that is how it started out anyway. What is
embraced as a real risk is equally dismissed by the same logic. Anyone
who worries about CNS tumors induced by cell phones, must allow that
they could suffer spontaneous combustion from the same source, same
risk. Risk, after all, is not a thing, it is a number. Without data,
employing risk as rhetoric automatically elevates everything that was
once inconsequential to life threatening.

However, as to your literal statement above, I feel it is "very
likely" that you HAVE heard "not likely" turned into a certitude:
"...due to the nature of Improbability calculations,
that which is Infinitely Improbable is actually very
likely to happen almost immediately..."

And I feel it is "very likely" you can name the author.

I have always found a good cigar, a stiff vodka collins and getting laid has a much more beneficial effect on my general well being ... a good chat over the cell phone with a close friend "bragging" about my good luck seems to add some pleasure to this experience also--your mileage may vary ...

If the chilled sodium, water, phosphorous don't work for you, you may consider my choice(s.) ;-)

Exactly! Not. The power or lack of it on the part of cell phones to cause much direct thermal heating does not mean that one who experiences the sensation of heat is not feeling it. The Jalepeno has a chemical which triggers pain receptors on your tongue, mucus membranes and skin. Your sodium example - and puhleeze don't anyone try that,it is an extremely vigorous reaction - is based on sodium's reactivity with Water. Just as the odd heat sensation that some people get from extended use of a cell phone, there is probably something else going on.

Direct thermal heating via cellphone is at best a red herring. Heating sources abound, so I just don't buy it.

> You willing to witness this test (sodium or phosphorous) to confirm
> the supposition?

I'll pass. I wouldn't mind watching from a distance though. I'm foolish that way. Remember, I'm the one who uses a chainsaw to dig his radial trenches. (Don't try this at home kids!)

> Better yet, can you prove that the jalapenos don't lead to CNS tumors.
> Are you willing to accept the responsibility for your stand that they
> don't.

Side note - they've recently found out why hot food is popular. Over the years, people have suggested reasons such as making people in tropical zones sweat to cool them off, or a sort of masochism. I never bought either of those, although I can get a good hot food sweat going, but it just didn't make sense to me.

Turns out that after the initial burn, the same chemicals give you a bit of euphoria. Receptors in the brain apparently enjoy it.

Looks like a new target for the war on drugs! ;^)

"Your honor, the task force did observe the defendant consuming several objects that after testing in the lab and from stool samples, turned out to be capsicum annuuum" We arrested him on the spot, Tasers were used, as pepper spray would only enhance his high, and would possibly lead to a Hot High, during which offenders are known to experience superhuman enjoyment."

Michael:

I don't know how "the course of the river" has been diverted to the argument that "heating" is the "consideration of danger" a prudent man would, at least firstly, exercise in thought/logic/research.

It is the energetic/fast/absolute reversal of the dipole water molecules (and even oxygen molecules) which would seem the most obvious area of exploration ... indeed, I have seen reference made to the "spinning" of this molecules.

This:

"Dipolar Bonding in Water

The dipolar interaction between water molecules represents a large amount of internal energy and is a factor in water's large specific heat. The dipole moment of water provides a "handle" for interaction with microwave electric fields in a microwave oven. Microwaves can add energy to the water molecules, whereas molecules with no dipole moment would be unaffected.

The polar nature of water molecules allows them to bond to each other in groups and is associated with the high surface tension of water. The polar nature of the water molecule has many implications. It causes water vapor at sufficient vapor pressure to depart from the ideal gas law because of dipole-dipole attractions. This can lead to condensation and phenomena like cloud formation, fog, the dewpoint, etc. It also has a great deal to do with the function of water as the solvent of life in biological systems. "

From here:

http://hyperphysics.phy-astr.gsu.edu/hbase/electric/diph2o.html

Makes note of the fact microwave DO cause noticeable effects/affects in just water ... there are other polar molecules in the body which have NEVER been the subject of study in relation to microwaves ... this is simply a fact ...

Those who would claim all is known, nothing of significance will ever be discovered of microwaves, even low levels, effect on the body, are simply idiots--isn't that obvious and totally apparent? If these idiots can convince others they have some form of "psychic knowledge" which requires no more scientific testing/exploration--well, the term, "Buyer beware" comes to mind ...

Why would anyone argue against "confirmation of safety", unless one has a horse in the race or is just an idiot with "a message from God?"

JS

For ham goodies look at the specs. Ham stuff usually needs to be more bulletproof than commercial but it aint'. You would probably be all right with the 100 watt kit for quick tune-ups unless the fine print says 100w for 10 seconds. It isn't the 200w pep to worry about, it's the 160 w CW and FM and how long you lean on it. Five seconds on and off three times should be all you need to get it tuned or get a reading.

I have an old Bird Termaline, oil filled, rated for 20 watts that I have used for years on barefoot rigs. I would never go smaller than that because the heat may rise too fast and burn the oil and anneal the contacts of the load resistor. I have used a big 500 watt Bird for continuous burn-in (weeks) of 100 watt FM repeaters and Base transmitters though. It is all about duty cycle and whether the heat can me moved out fast enough to prevent damage to the resistors and contacts.

Dry dummy loads are a different story. Don't put more than double the rating even for brief periods unless they are well heat sinked..

Well, I certainly do respect old Albert.

I was reading through this and enjoying it. Then I came upon this line:

"I know not with what weapons World War III will be fought, but World
War IV will be fought with sticks and stones."

Whoa.

Then again, I don't get too mad at Richard. He's got quite a command of
the language, and can be a bit acerbic. But he keeps me on my toes. More
like I'm running to keep up.

One way to tell is by looking around you to see how those around you are
being affected. Perhaps the MEDIA causes the most brain damage on the
planet by spreading madness on grand scales. I can point to a whole lot of
people who WERE harmed in so many ways by Tobacco products. I can only
point to ONE who has been harmed by RF. The guy leaned up against an
inverted V and grabbed on to it. Probably 5kw and it killed a line in his
palm. It did completely heal though. Still I wouldn't consider a ban on
either, as long as the user can keep it from costing or endangering me.
Don't forget there is a political agenda to do away with a lot of things.
The RF hazard thing is based on a minor risk blown out of proportion by

those whose million dollar views were spoiled by transmitter sites. If it weren't for well funded environmental lobbyists, the FCC wouldn't have been pressured into cutting exposure limits to half from what was learned by military studies in the 40's to the 60's and established in the 70's and cut to half of that in the 80's and finally made into law for hams and cut in half again for nervous people who still can't point to anything more concrete than the old military studies. Those same people had oil production cut in this country so that now you have to pay $4 a gallon. Who profits isn't always the point. Some people have to be vindicated even if it comes all out of someone else's pocket.

BTW I don't even own a cell phone. I have had them but they are too much of a distraction.

Mad? Hmm, never got much from it ... but, been there, done that; likely
to repeat the same mistake(s.) :-(

However, "spiking the debate/discussion" in not below my reach. ;-)

It takes a whole bunch of different types to make things interesting ...

Warm regards,
JS

I developed a liking to high power at an early age ... also, brought my fingers within too close a distance to a plate cap of large transmitting tube at this time ... all it took was one hole completely though my finger to gain a HIGH appreciation for caution around high power RF ...

I would like to tell you this single lesson was enough for me -- it wasn't ... still, I eventually learned.

Now you know two stupid guys. ;-)

sounds like a good idea - might try using 2 blades if you can.
I have also heard of buying a new chain and bar for your chainsaw, then
using the OLD one to cut a path through the yard.
But whatever you do, do not even think of touching a shovel - that would be
un-ham-like. :-)

In this part of the world, you can rent a Ditch-Witch or Trench-Wench which use a similar concept, but the chain carries cutters designed for earth and rocks rather than one designed for wet timber.

Ditch-Witchs and Trench-Wenchs aren't very good for cutting trees, nor are chainsaws very good for digging trenches.

You don't have to invent a new tool for this application, plumbers and electricians have been inserting narrow conduits / pipes in earth trenches for decades using these types of machines.

An alternative to renting a machine may be to find a plumber who specialiese in in-ground sprinkler systems... and get a quote for him to dig your trenches.

Owen

Ouch! I was hit once with about 50 watts. One of my first antennas was
a random wire, and RF was coupled to the metal ring around the tuning
cap on my matchbox. Hurt something awful, put a hole in my finger, and
there was even a little smoke. That guy must have really hurt.

Who was it here that told about birds landing on ladder line and
getting zapped. leaving only their feet wrapped around the line?

Well, that is one of the reasons. We sometimes tend to focus pretty
narrowly. That some of these folk don't like much of anything is pretty
spot on. But we shouldn't carry that over as blanket condemnation. Its
like blaming the little old lady sitting at home drinking her sherry
with binge drinking college students.

> concrete than the old military studies.

There have been lots of studies since then.

> Those same people had oil
> production cut in this country so that now you have to pay $4 a gallon.

The supply/demand effects of our oil production via offshore, or unused
interior drilling, are not responsible for the prices we are paying now.
There is a combination of massive demand by the developing countries,
large demand by ourselves, and rampant speculation.

There is also the issue of we really only have so much oil. And we've
used most of it (unless you ascribe to the abiotic oil theory)

Don't discount the possibility of sitting on reserves. In our area,
there were gas and oil wells drilled between 25 years ago, and the
present. Most of them sat, some to the point of needing new caps put on
the wells because the old ones got rusty. But there are many hundreds,
perhaps thousands of wells there. As we speak, there are new pipelines
being put in to bring the stuff to market. Simply when the price became
right, the supply was "uncorked". And it looks like there is a lot of
it. More gas than oil, but still significant.

Not a liberal or a tree hugger in the mix. Just good old supply and demand.

You want to point fingers? There has been a bubble of shady speculation
running through the business world. A few years back, it was the Dot.com

bubble. then it was the criminally innovative accounting practices that burst Enron and World.com into the news. Then it was the real estate issue, with loans so bad that some of these people were folding back their interest payments into their principal. That is insanity. How on earth could such a thing be allowed or legal? But the people originating the loans had not reason not to. They got their commission, and the loan was immediately sold to some other institution, who would then play a game of "hot potato", whoever was holding the mortgage when it defaulted was the loser. Interesting that the gasoline prices went haywire so soon after the real estate markets collapsed. These folk (a very loose aggregation, but certainly a trend) just moved from one form of speculation to another.

Speculation is and should be a good thing, allowing money to be put into risky and unproven fields. But it can be taken too far. See the above.

> BTW I don't even own a cell phone. I have had them but they are too much
> of a distraction.

I'd rather not, but I have to.. 8^(

Perhaps. But I use a chainsaw none the less. I've got a cheap electric
one just for the purpose.

> You don't have to invent a new tool for this application, plumbers and
> electricians have been inserting narrow conduits / pipes in earth trenches
> for decades using these types of machines.

Ah, but that rental cost is something. I'd be looking at hundreds of
dollars each time I do it. Thousands if I hire someone.

That 40 dollars I spent for the electric chansaw is cheap by comparison.
And very very quick. Yeah, it ruins the chainsaw blade and bar. At 40
dollars, I consider the whole thing disposable. I could buy a lot of
them for the price of renting the trencher.

I should make the standard disclaimer here. I'm not suggesting that
anyone use this method, In fact, don't try this at home kids. Anything
sharp can be dangerous, so leave everything you do to the professionals.
(that was a disclaimer, not a jab at your sugesstions, Owen)

> An alternative to renting a machine may be to find a plumber who

On the other hand, there's a big difference between a "slit into which a cable/small conduit can be stuffed" and a 4" wide trench with a ridge of dirt along side.

Mind you, I am a HUGE fan of the gas powered trencher, but it's a pretty invasive approach.

You also have to really contemplate "shovel and back" vs trencher. I had a 100 ft or so gas line installed a year ago, and the plumber just got the shovel out and trenched it by hand in a couple of hours. That's comparable to the time I spent going down to the rental yard, getting the trencher, bringing it home, unloading it off the trailer, spending 30 minutes trenching for the irrigation lines, then returning it.

And I'm not sure my back was any better off than the plumber's at the end of the day.

Granted, the trencher is nice in dense, rock filled clay, where a "digging bar" is part of the required tool complement. The plumber had the advantage of digging where I had previously dug some years before.
>
> You don't have to invent a new tool for this application, plumbers and
> electricians have been inserting narrow conduits / pipes in earth trenches

There's also a sort of walk behind motorized plow for doing this sort of thing. I saw one at the rental yard a few years ago. It has a sturdy steel blade that has a sort of overall V shape, and fairly large tires driven by a geared down gasoline motor and a bunch of ballast. I think the advantage of this is that you can drive it across a lawn to lay a cable or pipe and not have to do a bunch of resodding after you are done.

In any case, as the poster comments, this is a pretty standard overall
task, and there's lots of ways to do it.

The small trenchers rent for $35/hr in my area (4" wide x 24" deep).
There's a 2 hour minimum. You can dig a LOT of trenches in really hard
soil with lots of rocks in 2 hours. I also found out you could have
them deliver the thing and pick it up for $80 (which is a lot of money
if you happen to have a vehicle that can tow a small trailer, but if all
you have is a compact car, it's a lot cheaper than renting a truck)

In any case, not hundreds of dollars.

I would suggest taking a look at the latest IEEE/ANSI standard for exposure. The actual limits in the standard only take a few pages. The other 100 pages is the critical analysis of the hundreds of studies with respect to every effect one can imagine, and then some.

As Michael points out, there's been a LOT of studies in the last few years (driving, for instance, a change from field strength limits to SAR limits in some cases)

What the standard and accompanying analysis makes very clear, though, is that there is no way to "prove a negative": i.e. there is no way to "prove" that a particular EM field exposure doesn't have any long term effects. All you can do is say that there is no known mechanism by which such an effect can be produced, or that if it does exist, there's no way to measure it in a statistically significant way, or, in some cases, that greater exposures have been shown experimentally to have no moderate term effects (e.g. nobody's done a longitudinal study lasting 30-40 years that's been controlled for other confounding effects).

What you CAN say is that the studies prompting the early alarmist literature (e.g. "currents of death", "VDTs cause miscarriage") have severe methodological or statistical problems. Unfortunately, those early studies have been (poorly) abstracted and summarized many times and the caveats in the original paper, or subsequent better studies, are ignored.

Particularly in non-technical trade literature (e.g. trade magazines aimed at, for example, small business owners), the author of an article writing about minimizing hazards in the workplace might not actually know very much about the details of the hazards, nor do a whole lot of

research beyond what's in Wikipedia or copied from some other trade magazine. They certainly don't go back to the original source, nor do they look at current standards, etc. I still run across articles that (indirectly) cite the famous (and totally misinterpreted) Kaiser VDT study from 1981/1982, published in 1988. While that study found a correlation, one has to remember correlation is not causation. Someone googling VDT and miscarriage will no doubt turn up articles in the NY Times from 1988, for instance, but not pay attention to the fact that the article is 20 years old, because, on the web, the date is tiny print and grey.

I have a hand tool that's considerably better than a shovel for cutting a narrow slot. I think it's intended to be a manual edger. It's on a handle like a shovel but the blade is flat, semi-circular, and sharpened. You can push it into the ground by stepping on it, then you can rock it to widen the slit it cuts. I wouldn't try using it here in the summer when the ground is basically adobe, but it's reasonable in the winter when the ground is wet and soft. I don't think it would make a slot deep and wide enough for conduit, but you could probably use one to get bare coax under the sod and mower.

I am the original poster. I just got done using my gas powered lawn edger and it worked fine. I had to cut 2 slits for my Direct TV cables. 1 was for High Dev cables and the other for the digital cables. I couldn't get them in one slit. My 2 cuts were about 35 feet long.and about 2 inches or so deep. We had a full day of rain here in Illinois so it may the cutting easy. After I got them in the slits I took a 3/4" board and gently tapped the cables down in the ground. I hope that freeze this winter doesn't heave them up. Thanks for your comments.

I said TWICE now, that I'm getting the filters.

1344. E-Field between 2 parallel wires

Newsgroup: rec.radio.amateur.antenna

MAYBE NOT EXACTLY THE RIGHT GROUP, but..

If I tape 2 insulated, parallel wires to the wall, x cm apart, and then drive a sinewave into them (Vo p-p), how can I calculate the field strength between the 2 wires?

For instance, 120KHz, 100V, 5cm apart, what is the field in V/cm between the two wires?

Any references or information on how to calculate this would be greatly appreciated.

Is the sine wave applied and the load, if any, connected such that the currents in the two wires are equal and opposite? If so, the problem becomes exactly the same as a single wire suspended above and parallel to an infinite perfect ground plane. In the plane exactly midway between the wires -- the position represented by the perfect ground plane in the simplified model -- the field is zero, since the fields from the two wires are equal and opposite in that plane. If the currents aren't equal and opposite, the problem becomes considerably more complex.

By "between the wires", do you mean in the plane of the wires, or some larger region?

Are you looking for a closed-form solution, or would a numerical analysis result be adequate?

If this is a homework assignment, the professor assigning it should be able to steer you to some suitable references.

Models are available here which cut a trench about 2" wide, and to a depth of about 18" max, and pile the fine spoil neatly clear of the trench (rather than in the operator's boot etc).

I have used them on electrical contracting jobs, and they work a treat. They will cut through small tree roots, deal with small rocks, and are easy to backfill neatly.

Hmmm...I don't think that's quite right, Roy. I expect the E field
between the wires, in the plane of the wires, to be parallel to the
plane, perpendicular to the wires, if there is a potential between the
wires and they are straight and parallel. For a wire above ground,
the E field must be perpendicular to the ground at the ground (assumed
perfect), but it's not zero in general.

Cheers,
Tom

In the end, none of what transpires in life truly matters anyway. I am a believer (God, I hate using that word - oops!) in non locality. As such, and believing that all that has ever happened, or ever will happen, is bundled up in one tight little ball of data, we have no free will anyway, thus, nothing is a matter of choice. It simply is and we're just those little football players on the magnetic football game of life. Enjoy what you can and ignore the rest.

I used to have an AEA Isopole 2M antenna before Hurricane Hugo took it down. In tribute to this antenna I would like to build a 2.4 Ghz version for my wireless router. I have assembly instructions for the 2M version but I dont know how impedance matching for the 5/8 section was accomplished. Was it just a series coil? I may also try to roll my own 2M version of the antenna. I used to really enjoy when neigbors would ask what the heck that thing was.

I can help just a little. Some of the Isopoles are a DC short, meaning they
have a shunt coil, too. I say that from knowing my 220 Isopole.

1354. How do you get a ground rod to 6 feet ?

The soil in central Texas is called Caliche with a lot of clay,
CaCO3 & shale. Attempting to drive in a ground rod
yielded only a mushroom on top & blisters on me.
Local tool rental place has concrete bits, but maximum
length of 18 inches. Possibly longer bits are available in
a larger city.

Renting a back hoe is out.
Any suggestions appreciated.

I lived for many years in the Dallas area. The caliche was down about 2 feet and was about a foot thick. I had to dig a hole with a shovel down to the caliche, then use a heavy hammer and long chisel to get through the caliche. Then, backfill and proceed as normal. Don't know what your configuration would be. Good luck.

Thanks Wayne.
As a last resort I will hack a trench with a pick and lay in the rod
at a shallow angle to the surface. Would this give an adequate
ground ? I could also bond it to an outdoor brass spigot
10 yards away or even to an anchor fence in the other direction.

In my opinion the trench would be ok, but I'll leave that to the experts on
the group.

However, I remember chiseling through the caliche to be annoying, but not
that difficult with the right tools. It can be done with a "shooter" style
shovel, but that is a bit more effort. However, I doubt if you would ever
get a copper rod driven through without some major damage to the rod.

I'm having thoughts of steel pipes filled with
muriatic (swimming-pool) acid eating through
the caliche chemically. Usual acid-handling
precautions would definitely apply.

Dave-

Last year there was a discussion here about sinking a ground rod using an "SDS Plus" Hammer Drill set to hammer-only. I think it was Ian White, GM3SEK, who proposed that method. There is also an article at <http://www.n4lcd.com/groundrod/> that proposes a slightly different method of coupling the hammer drill to the ground rod.

The question is whether Caliche can be penetrated by such a method. Has anyone tried it?

Another consideration is whether or not there is moisture in the soil below the Caliche. If not, then it might not provide a low-impedance ground even if you could penetrate it!

If you don't have all the tools described above for an elegant way to drive
a ground rod, it isn't that bad by hand. The secret is to dig through the
soft dirt to expose the caliche. I used a crowbar hammered with a small
sledge. It isn't too bad for just a ground rod, and might be quicker than
looking for/borrowing more tools.

I planted a 60 foot self supporting tower in a hole 3 ft by 3ft and 6 feet
deep. I would have preferred an elegant solution for that!

I know the stuff you are talking about, it will even jam up a
Ditch Witch

When I was in San Antonio with the USAF we made a spade
bit out of metal rod and welded the spades on the side.
We stared the hole with a post hole digger, filled it with water.
then drilled down into it. After drilling a couple of feet we were
able to pound in the ground rods
Im thinking using a real spade bit with an extension may work.

They pave roads with caliche in West Texas. From Wikipedia:
"Caliche is also used for road construction, either as a
surfacing material or, more commonly, as a base material."

That caliche must be something else. I've never heard of it. But I must question either your selection of ground rod, or method of insertion. I've sunk a number of ground rods in semi-rock.... sometimes penetrating granite too.

We used 5/8" copper clad steel, or sometimes 3/4" copper clad steel rods. We also used rotary impact hammers to drive the rods down.... often right through a rock or whatever. Worked almost all the time, and did not "mushroom" the top of the rod.

If a 3/4" pointed solid steel rod can not be driven through Caliche with an impact hammer I can't imagine any other tool short of dynamite doing the job.

Ditch Witch also makes a device that looks and operates very similar
to an edger but cuts deeper
and piles the dirt neatly beside the cut.

Ditch Witch makes a trencher that is exactly like an edger except it has a guard that piles the dirt up along side the the cut.
I have also known of people putting a concrete cutting blade on an edger and cutting through a curb with it. Probably two things you shouldnt do.

Here's a snippet from the state of Washington's website that quotes the NEC:

NEC 250-52 (c)(3) (1999 edition) requires that ground rods "be driven to a
depth of not less than 8 feet
(2.44m) except that, where rock bottom is encountered, the electrode shall
be driven at an oblique angle
not to exceed 45 degrees from the vertical or shall be buried in a trench
that is at least 2½ ft. (762mm)
deep."

The requirement is that the rod be driven to a depth of 8 feet. If the rod
cannot be driven then there is a
choice of either driving it at a 45-degree angle or laying it in a trench
that is not less than 2½ feet deep.

http://www.lni.wa.gov/tradeslicensing/electrical/files/currents/elc0210.pdf.

I browsed some newer discussions and found nothing newer to be at variance
with the quoted material. The current NEC is $75 if snippets won't do ya'.

http://www.nfpa.org/itemDetail.asp?categoryID=860&itemID=21227&URL=Publicati
ons/

You need 25 ohms maximum rersistance (three-point method) to say you have a
good ground.

The other point was that SDS+ bits are available up to 1.0 metres long,
so by using both rotary and hammer action you can drill a pilot hole
through most kinds of rock down to that depth.

>There is also an article at
><http://www.n4lcd.com/groundrod/> that proposes a slightly different

We don't have caliche here, by that name, but from accounts on the web
I'd doubt if it could be penetrated by hammer action alone. However, it
seems more likely that an SDS+ bit could drill through it.

>Another consideration is whether or not there is moisture in the soil
>below the Caliche. If not, then it might not provide a low-impedance
>ground even if you could penetrate it!

That is certainly the problem at this QTH, where an earth rod drilled
and hammered into the very rocky subsoil produced a resistance of
500ohms! Long horizontal electrodes are the only kind that work at this
QTH.

While I don't have any 'caliche' on my property, I am blessed with a lot of randomly placed rock. Driving any ground rod to about 6 feet is a guessing game more than anything else. I've found that ground radials are more practical. Not easy, just practical. They seem to work as well as any ground rod I've ever used (better in some instances).
The local power company is supposed to put down ground rods for safety. Having seen some of their methods, I'd tend to go with the radials (ground wire attached to water pipes... PVC water pipes, great idea huh? And, NO, I'm not kidding.)

I have a Glen Martin ground rod driver (fashioned after a fence post driver) that worked fine in Houston. In San Antonio, it only drives a rod about one foot down, then muck... I ended up just driving a short rod, mainly used as a connection post, and then I extended several long, buried wires out from it.

I got a better ground than using a stake by doing something a little unorthodox.

I buried an old channel 6 yagi antenna in under six inches of earth. It made a pretty good ground. It was a lot better than a stake.

I concur. Unless you're going to leave the transmitter keyed up for minutes
or hours even a 50 watt dummy load is quite sufficient to tune up my TS
820S, which has essentially the same finals. Done it for years.

Dave,

If you truly cannot drive an electrode vertically, then you will need to consider drilling for horizontal electrodes in trenches chased into the rock. Drilling creates another problem, backfilling for conductivity.

Electrodes in dry rock might not be very effective.

I have had success in driving electrodes into moderately shaly ground, and even very dry clay isn't too difficult. Pointed 19mm copper clad steel rods or stainless steel rods are a lot easier to drive into hard stuff than smaller sizes.

The following article shows some of the equipment that I have used sucessfully, and likely to be more successful than using an ordinary hammer. Machine driving does not mushroom then end of the electrode near as much as hand hammering.

if you are looking for a closed form solution you will need to investigate some classical electrodynamics methods for wires on a dielectric half plane. There are probably some not so elegant methods to calculate it using the relative dielectric constants of the air on one side and the wall material on the other. The field will of course be different in the wall material than in the air. as a first approximation you can take an average of them and use that to estimate the field as if the conductors were embedded in an infinite block of dielectric material, that is probably a simpler problem.

there are programs that will do finite element analysis and come up with numerical solutions, that is probably simpler in most cases than the raw field equations.

For a relatively low frequency like 120khz and those low voltages you can bound the problem by assuming 2 wires in air... 100v/5cm=20v/cm half way between the wires... with a material on one side it will usually have a lower field than in the air by approximately the ratio of the relative dielectric constants. For wood the constant depends a lot on moisture content, from a low of maybe 5 up to 100 for saturated wood. The higher the dielectric constant the lower the field in the material, as a first approximation with a constant of 5 you could guess that 80% of the field was in the air and 20% in the wall... and of course the farther from the wires the lower the field... so from a max of maybe 20v/cm between the wires the field will decrease as you move away from the wall in air, and decrease about 5x faster as you move into the wall. the hard part is close to the wires, there it depends on the diameter of the wire, the smaller the diameter the higher the field, to get those numbers you need one of the other methods above.

If the soil is permiable to water, you could try another of my hack
methods. Sweat a garden hose connection onto a piece of copper tubing.
Attach a garden hose to the fitting, and point the rod down in the place
you want to sink int. Then let it rip. In my area, we have a few inches
of topsoil, than a really hard clay, then rocky clay, followed by sandy
clay/sand. It will even move some rocks out of the way. The tubing
becomes the ground rod of course.

That's a good question. Batteries do warm in operation, but the radio heatsinks are often the back panel, driving heat into the battery rather than your hand. People complain when they burn their hand so designers are content to just sell more batteries.

Hope I did not confuse ! I used a rotary impact hammer in all my years of ground rod driving, but only used impact mode..... the rotary mode would only turn the hammer head, not the rod . .. anyway. Most of the time I had a sized Bosch tool, not some cheap import.

I wouldn't bother. Especially if all your stuff is not all on one floor. I
once had a 2m Isopole on the roof. Worked better than the 1/4 wave in the
attic in some directions, not as good in some other directions.

Hello,
Can someone tell me if Brian Beezley's program COIL.EXE is still available?

If it is, could someone point me in the right direction?

I have Googled it but nothing useful comes up.

Thanks HarryH

Absolutely. I am not at all afraid to use my cell phone in moderation. It isn't going to make me drop over or faint - unless Ed McMahon calls me about my PCH prize.

The issue to me is that we are seeing some effects that are more subtle than nasty diseases or imminent death. Those early and poorly done studies did not help for sure.

But you can see out on the roads - something is happening. There are stone sober people who are driving like drunken people. Their reaction times are bad, they make poor decisions they have trouble staying in their lane, they drive through red lights and remain stopped at green lights.

Some of the excuses given for this behavior just don't wash if you ask me. Things like driving distracted, while plausible, have a niggling problem. People like the police and Ham radio operators and plenty of other folk use radios daily, yet when was the last time that you heard about say a State Forest Ranger getting in an accident because he was using the radio?

Many of these cell users survive on the good graces of other drivers looking out for them, and avoiding them. Whereas once I would look at the cars around me in a general fashion, I now zero in on the driver to see if they are talking on their cell, or even worse, texting, I then chart my course to separate myself from them as far as possible. Problem is, there are too many of them on many local roads, and those places I just avoid.

But I think is is just plain sad that we have to drive with impaired drives every day.

The thing I find odd is that this behavior is verifiable and widespread, and yet to point it out and ask the question "Is there something going on here?" gets one labeled a kook.

And yet, if these very same drivers were driving intoxicated and killing and injuring people, there would be the same old hue and cry. Is a

person killed by a drunk driver more dead than one killed by one using a cell phone, and driving the same way as the drunk guy?

As the comedian once said "Drive carefully on the way home folks - it only counts if you get killed during the holidays!"

Hi Mike,

Am I the only one to recall that time when it was AGAINST THE LAW to
operate a ham radio while driving for EXACTLY THE SAME REASONS you
have witnessed with cell phone users poor driving performance? Having
a rig in the car came with the legal distinction of operating mobile
and operating remote. I've lived in states where you could only
operate remote, and it was against the law to operate mobile. Consult
old copies of the Ham rags for various campaigns to change the laws
(even to operating remote).

If the laws changed at all, it wasn't because of our legislative clout
so much as it was the telephone company's.

Ham radio operators behind the wheel and engaged in a QSO exhibit no
greater care than the ordinary driver on the cell phone.

My half-duplex ham radio seems less distracting
than my full-duplex cell phone that I have to
hold to my ear and mouth at the same time.

Actually I don't, but okay.

Does it therefore follow that because those reasons turned out to be wrong for operating Ham radio mobile that they are wrong for cell phones? Despite the differences.

One of the more amusing aspects of DUIC driving is the slippery sloping done by people. Equivalents are attempted to assure us that cell phones are as safe as anything else because, hey, eating or drinking coffee is a distraction, and just talking to the person beside you is a distraction also. So the argument goes, you shouldn't discourage cell phone use because then you would have to ban eating, drinking and talking to anyone in the car.

> Ham radio operators behind the wheel and engaged in a QSO exhibit no
> greater care than the ordinary driver on the cell phone.

I would respectfully disagree there Richard. I'm nearly struck nearly every day by someone operating mobile. I haven't kept count, but over the years it's been possibly over a thousand times. You would think by now, one or two of them would have been Hams operating mobile. We have a very active Ham population around here, and the local repeaters are constantly in use.

(note that my off the cuff "stats" are compiled for both personal driving and pedestrian incidents and observed ones. Even if my figures are exaggerated by faulty memory, I've never been in a collision or near collision with a Ham during operation, or a truck driver while s/he was using a CB. Same goes for law enforcement and various communication vehicles.

I don't find that to be the case at all. Either for myself, or for
others I've discussed the issue with.
>

I agree with Cecil, I find radio QSO's to be *much* less distracting
than cell phone conversations. I think there are a couple of reasons
for that.

1) Cell phones usually are only in one ear, even with a hands free
headset. I find it takes considerably more concentration to process
audio that is delivered in that fashion and most of the other folks
I've compared notes with find that also. The cabin filling audio of
the radio speaker which is heard by both ears is much easier to get
information from.

2) I think there is a different cultural meme about telephone
conversations vs radio conversations. I think most of us grow up using
a phone in a household where we tend to turn inwards and pay attention
to the call and isolate ourselves from the room full of distractions
(TV, other conversations, etc). I think that's reinforced by the
relatively low audio level in the handset which tends not to overpower
the local environment's noises, you pretty much have to focus on the
conversation on the phone and we learn that behavior. I believe that
'phone' behavior is carried over into cell phone usage, and mobile
cell phone usage where it's obviously not a good thing. In contrast
most folks have QSO's with room filling audio and a whole different
paradigm for how they interact with a 'radio' device as opposed to a
'telephone' device. I suspect that part of the popularity of the Push
To Talk services offered by some cell companies is because they break
that 'phone device' paradigm.

3) The conversations themselves might command more attention. It's one
thing to be chatting with my buddies on the radio, if I drop out of
the conversation to pay attention to traffic or whatever, there are no
repercussions. On the other hand, a business phone call may command a
lot more of my attention - if my boss has gone to the trouble of
tracking me down on my cell, it's likely the call carries more weight
than a casual conversation with friends. That alone will cause me to

invest more attention resources to dealing with it than I will for a radio conversation, with whatever collateral effects on my concentration for driving. If I'm trying to think about a problem and do remote troubleshooting via phone, it's even worse and I better pull over (and do).

I find that all three of these factors combine to make a cell phone call much different than a radio conversation in terms of how it impacts my situational awareness while driving (or flying). While flying it's often the case that I'm listening to two different conversations on two radios (tower and ATC) to piece together a picture of what's going on in the airspace I'm in, and even that is less attention grabbing than a cell call.

YMMV

And so do others, all probably cell-phone users too. I challenge
anyone to replace QSO with conversation and Rig with Cell-phone and
notice 200 million cell-phone user's claim to driving perfection while
talking.

The count of those you've seen operating dangerously could expand to
make a line stretching along the equator - each claiming with as much
gusto to have never presented a risk and swearing at ham radio
operators as driving impaired.

The fact remains that the current complaint about cell-phone users
behind the wheel ealier provided the identical logic for enforcing a
ban against Ham radio mobile operation. Only two things have changed:
the law, and the number of mobile operators of both classes. What has
not changed is poor performance. There is nothing inherent about Ham
mobile operation that is safer than cell-phone use and claims to the
contrary are self serving.

Looks like we'll have to agree to disagree, or whatever, Richard.

There are some differences between operating mobile and using a cell
phone, but gosh, I'm kinda tired of the whole thing.

I think we've just about beat this one to death, so we might as well get
back to antennas. You can have last word privileges if ya like.;^)

Ohh, I just had to share this one though:

I was coming home from work tonight. Part of the rout is on a road with a center lane for left hand turns.

A lady pulls out from the left hand side of the road. She starts driving down the middle of the road in the left turn lane. I figured she was going to turn soon. Nope. She is going fairly slowly, so I figured I would drive past in th enormal lane. As I was passing her, I looked over and yup, there is the cell phoneI get past and continue. She drives the better part of a mile in the center lane, causing some people to have to get out of the lane, cuz she wasn't stopping. Then she comes up to the light where she apparently *did* want to turn left. But for some unknown reason, she went back into the travel lanes, nearly clipping the car beside her. The she stops, backing up traffic. Then she proceeds to make a left turn from the travel lane. Which cuts off the person who went into the turn lane legally.

Simply brilliant.

Quite frankly, I'm beginning to *hope* that my thesis about cell phone use causing people to become stupid is true, because otherwise I feel badly for so many people who are so malfunctionally stupid without any good excuse. I mean this lady is not going to last too long on the highway.

The big difference, I don't have to hold my radio up to my head limiting my ability to see around and I can keep both hands on the wheel with the mic on my lap most of the time. The cell phone just ties up more attention, my hand, my head, then there's dialing. I rarely did TT control in motion.

Law in California now! Must Be Hands Free with the car in motion. Under 18 no Ham radios either! Only because of lobbys and lawyers that they don't go after hams and CBers altogether. Of course they want to make it a law, no photographing police field executions either due to the cost of litigation to the citys.

1426. Dumb question about EZNEC

The minimum depth is provided by the building code. Since the footer
must be below the frost line the resultant Ufer Ground is also below the
frost line. If it's not it will be ineffective.

Tom is completely right -- as always. The problem is, as I said, the same as a single wire suspended above a perfect conducting plane. The E field is perpendicular to the conducting plane (that is, in the plane containing the wires as Tom said) and not zero as I incorrectly said. Thanks for the correction, Tom, and my apology to all for the error.

To split hairs a bit, you can build a Ufer ground that isn't a
structural footer, and so, may not be subject to the frost line rules.

1434. Microstrip formula for non-standard geometry

Hello,

Most formulas for microstrip transmission line assume that there is
dielectric all over the ground plane.

Does somebody know a formula (or graphical solution) for the
characteristic impedance of a microstrip where there is only
dielectric material under the strip (so you can see the ground
plane)?

Best regards,

Wim

The above link is a wonderful arbitrary solver for transmission lines.
This is primarily a Unix program. If you need a Windows build of the
program, I probably have version 4.4 somewhere.

Hello Mark,

This is good one (I found it via google also). You can enter both
metallics and dielectrics as you want. It would be very nice when you
can mail me a Windows Build (I hope it is not that big). A link would
also be useful.

My address is valid when you remove abc.

I'm tempted to make some statements that I can't quite prove without doing a bit of math, but I'll refrain...

But I will recommend the program ATLC ("Arbitrary Transmission Line Calculator"), which does calculate the electric and magnetic fields numerically.

Except for changes in the current distribution because of changes in skin depth versus frequency and changes the dielectric versus frequency, I don't think there's any effect of frequency on the fields distribution for a TEM-type line, where the current in the two conductors is equal amplitude but opposite direction and the line is in a uniform dielectric. Taping it to a wall will make is "quasi-TEM" but you can expect the electric field direction to be very close to being in a plane perpendicular to the axis of the wires.

Cheers,
Tom

1441. Modified G5RV

I've been playing around with EZNEC instead of mowing the yard.
A standard G5RV works well on 75m, 40m, 20m, and 12m. My
favorite band is 17m. If the G5RV dipole length is changed to
94 feet, and the series section changed to 40 feet of 450 ohm
ladder-line, the resulting configuration will work well on
40m, 20m, 17m, 12m, and 10m, according to EZNEC.

AFAIK dielectric between the strip and GP is the most significant unless stripline is to couple to other stuff. Anytime you change board material there are subtle changes in VF. For proto, I always like to allow for trimming where it has to be critical, but best to make it less critical so you don't have to spend time on every board. Air is better, but spacing variations come into play, and what will happen if you drop it. The calculations only get you so far unless you have your constants handy.

So how would they be fed? Monopole needs a GP or fed as doublet. I have
anxiety just looking at it.

Inverted L is soo much easier.

They would be fed though a series capacitance to a tap on the lower
coil, at a point to obtain a 50 ohm feed point, generally ... and
considering the 1/2 wave design.

A 1/4 wave design would simply be fed at the base of the lower coil with
a sufficient ground plane provided ...

... in the monopole models.

A T or Delta match could/would be implemented on a dipole version.

JS

1446. Coupling a T2FD to a S350DL

Newsgroup: rec.radio.amateur.antenna
Date: 2008-08-26 21:19:42 UTC
From: Bubblesdee <Bubblesdee.2fa4e6b@radiobanter.com>
Message-ID: <Bubblesdee.2fa4e6b@radiobanter.com>
Source record: 23071

Hi

I am new to this forum and have a (most likely) dumb question

I recently aquired a S350DL receiver. I will be using this rig until I can buy a rela communications receiver. I will be using it to receive Shortwave only. I have constructed a T2FD (Tilted, terminated, folded dipole) with a design feed point impedance of 300 ohms. The S350 DL only has an unbalance high impedance external antenna point and a ground on it. How can I attach the T2Fd to the S350Dl and acheive a good impedance match.

1) Is the whip antenna on the S350DL a low impedance feed point (i.e. 50 or 75 ohms)? If so, could I use a 4:1 balun at the feedpoint of the T2FD to convert the feed line to 75 ohm coax (which would be unbalance line now) and just clip the center conductor to the whip and the sheild to a grounding rod?

2) I could use 300 ohm ladder line to connect to the T2FD but the problem is that the S350DL does not have a balanced esternal input point on it.

I guess what I am asking is what would be the best way to couple A 300 ohm T2FD antenna to a Crappy Radioshack S350DL receiver and achieve reasonable impedance matching.

I do not what to use an end fed long wire.

Any help would be appreciated.

Source record: 23070

Hello,

Wondering if anyone can explain to me how to grid-dip trap coils to determine which coil is for which band to be used in the 10 thru 40 meter 1/4 wave trap vertical originally made by Swan. The antenna was completely disassembled and, since it is so old, the markings on the metal sleeves of each trap has weathered away. For me, it would be much easier to dip the traps to determine the frequency rather than climb up on the roof to do the cut-and-try method for each band (small back yard, no room to ground-mount the antenna).

Any help greatly appreciated. Thank you,

Tim Watkins

Drifting further off topic.... Here's the commercial incantation of
that antenna (the three photos on the right) from Tecom:
<http://802.11junk.com/jeffl/antennas/tecom/index.html>
PCB losses make it a rather marginal performer.

Note the added decoupling sleeve. That somewhat beam uptilt due to
the effects of the mounting hardware.

The worst part of the design is that 1/2 the RF is radiated in the
first half wave (bottom two elements). 1/4th is radiated from the
next half wave. 1/8th from the next dipole, and so on. By the time
what's left gets to the top element, there's not much left. With all
the RF coming from the base of the antenna, and with the uptilt
problem, it's often best to mount the antenna in an inverted position.

I have an NEC2 model somewhere but it has problems. Sorry.

However, I do agree with the article's conclusions. It is a cheap
antenna to build.

As for the original question, ATLC is certainly the right answer for
modeling a rather unusual microstrip configuration. The program can
allegedly be built using Cygwin for Windoze. I haven't tried it:
<http://atlc.sourceforge.net/installing.html>
Note the spelling of Windoze on that page. I looked through the
ported package list, but didn't find ATLC.

On HF, matching imp for receiving should not make much difference give-or-
take a few 100%

I suspect whip antenna is high imp. ~2k and unbalanced. You would need
to make a one2one or four2one matching xformer placed near the radio with
ladder line coming from antenna. This will stop common mode noise from
entering your radio via feedline. Two 300->75 ohm TV xformers back to
back should work.

twinlead 300 xformer 75 short coax 75 -> 300 twinlead

gator clip the xformer output to your collapsed whip
antenna and ear jack ground.

If you get allot of intermod from front end overload, place some
resistors between between whip and ear jack ground.

If you run MSWindows, why not download the free
demo version of EZNEC? It comes with antenna examples
that you can load and look at without having to
design anything.

We'll, there's not much that I can tell you about the design. It's a
log-periodic antenna built onto a PCB. It's not G10/FR4 and might be
Polysulfone. Like the LPDA acronym suggests, it's nothing but a mess
of dipoles at varying frequencies, which results in lots of bandwidth
and not much gain.

This might help with the numbers:
<http://www.changpuak.ch/electronics/lpda.html>
Use Frequency 800-1000MHz and 180mm boom length.
It's not exactly the same as the Sinclair LPDA uses staggered
elements.

Other calculators:
<http://www.fortunecity.com/skyscraper/jolt/345/LogCalc.html>
LPDA Excel Spreadsheet calcs:
<http://www.astro.hr/ucionica/radioastronomy/antenna/lpda.zip>
Another LPDA calculator (that I haven't tried):
<http://www.astro.hr/ucionica/radioastronomy/antenna/lpcad23.zip>

More light reading:
<http://www.wolfgang-rolke.de/antennas/ant_400.htm>
<http://en.wikipedia.org/wiki/Log-periodic_antenna>

A $40 commerical LPDA for 400-1000GHz.
<http://www.ramseyelectronics.com/cgi-bin/commerce.exe?preadd=action&key=LPY41>

If you want to see the effects of juggling spacing, element count, and
boom length, it's probably best to use an antenna modeling program.
Looks like you have EZNEC, which will work. If you download the 4NEC2
antenna modeling program, you'll also get a mess of example NEC2
files. There's a directory under:
c:\4nec2\models\logper\
with 4 log periodic antennas, mostly for HF. EZNEC can read them. I
can probably conjur my bad guess of a model of the Sinclair antenna,
but I'm playing vacation and would rather be doing something else.

I routinely use EZNEC to design antennas printed on a substrate. I do the basic design then apply a fudge factor to the conductor width and length derived from comparisons between model results and measurements of real antennas. Final designs usually take some adjustment even at that. However, I haven't tried this for any antenna that depends strongly on coupling between elements, such as a Yagi, because the mutual coupling will also be affected by the substrate and won't be so easy to approximate. In the case of a log periodic, I'd adjust the model transmission line to try and get the same Z0 and velocity factor as the line on the substrate, which you might have to determine by measurement. That would help, but you'd still be lacking accurate mutual coupling information. At best, I think, a model would get you in the ballpark, with a final design requiring some tweaking.

No, I can't. Neither EZNEC or 4NEC2 will model dielectrics.

Also, this might be useful:
<http://www.antennex.com/shack/Feb06/lpcad.html>
LPCAD 3.0 will generate an NEC file that can be analyzed by your
favorite modeling program.

Don't count yourself out on a general license. You don't have to be smart. You just have to be committed. I got my general when I was 11. I did not understand the theory at all. However, I was committed and memorized all of the questions.

I realize that this was probably a poor way to get my license, but I really wanted it and I was too young and stupid to understand the theory.

I once tried scaling a similar antenna for a PCB dielectric and ran
into that problem. I had G10 on one side of the elements and air on
the other, each with its own dielectric constant. Another version
used glass as a substrate. I made a simple breadboard for testing and
found that a good first guess was the geometric average (sqrt of the
sum of the squares) of the dielectric constants. However, when I
actually built the antenna, I had to do considerable tweaking and
guesswork. It's been many years, but I don't think my models and
reality ever agreed.

I also tried to use MSTRIP40 for modeling a dipole array on a PCB.
<http://rze-falbala.rz.e-technik.fh-kiel.de/~splitt/html/mstrip.htm>
It's intended to do patch and panel antennas, and works well for
those. It can also do a dielectric sandwitch, which might be handy.
However, when I tried to do a simple dipole array, I got bizarre
results, probably due to some mistakes on my part. A single dipole
works fine (it's supplied as a sample file), but I just couldn't get
arrays to work. I just noticed there's a later version available, so
I may try again. However, I'm playing vacation this week so it will
have to wait.

Did you notice the odd patches at the ends of the elements in the
photographs?
<http://11junk.com/jeffl/antennas/Sinclair%20SRL441-2P/index.html>
Methinks Sincair may have also done some tweaking.

Thanks for the hints.

1461. fiberglass mast question

Newsgroup: rec.radio.amateur.antenna
Date: 2008-08-27 19:04:14 UTC
From: Ed <Huckleberry_REMOVE_@bigvalley.net>
Message-ID: <Xns9B077ACA0133Huckleberrybigvalley@198.186.192.196>
Source record: 23085

Anyone have suggestions on a method I might try to "twist" and collapse some sections of my telescoping fiberglass mast? I put it up several days ago with perhaps a bit too much "vigor" in making sure it would not collapse on its own and now that I want to stow it away there are a couple of sections I can not unlock. My grip is good, but the sections are really tight. I hate to use something mechanical for fear of cracking the fiberglass and I hate to use a lubricant since the locking requires friction.

Thoughts ?

www.unwinantennas.com

By this week end a revised version on antenna design and the
implications of
equilibrium, static particles and the influence of the "weak" force
will be described in
their entirety, together with used computer program layouts where the
reader can check their
own antenna computor programs for correctness. This page is rewritten
so that naysayers
skilled in the art of antennas and physics can specifically address,
in detail, their thoughts
without the generalized thinking that all is known about antennas for
group discussion
as the basis for their analysis, such that we can all move forward
away from the constant
bickering and further advance the hobby.
AC6XG I haven't forgotten you.
The time will come,.....eventually !

Immerse outer end (only)in hot water. Hopefully it will expand slightly
,but not the inner mast part .

Alternatively cover outer end with insulation material and 'cool' inner
mast tube with evaporating CO2 'ice' hopefully causing it to shrink
slightly.

Of course success is not guaranteed but worth trying .....at least it is
non-destructive.

Let me guess. You extended the pole when the air temperature was cold
and are now trying to collapse it when the air temperature is hot? The
coefficient of thermal expansion is about the same as glass or
1.1x10^-5 inch/inch/F which is enough to expand the inner tubing into
the outer sleeve almost permanently. After a few field days of having
exactly the same problem, I sorta learned my lesson.

The easiest is to wait until it cools down at night. You can also
splash cold water on the joints, which might help. If you want to
prevent the problem in the future, I found that ordinary Ivory soap
smeared on the joint, makes a decent lube that will not cause
premature collapse. If you apply too much, just wash it off.

Also, do NOT beat on the ends in an attempt to release the seized
joint. The twist type telescoping locks will just lock even harder.

If brute force is your forte, you might try a rubber pipe strap wrench
as used to remove an automobile spin on oil filter. Wrap the strap
around a few times and put something under the gripper teeth to
distribute the force. I've never tried this but it seems like it
might work.

Also, make sure you're turning in the correct direction. I did that
once with a window washer pole with predictable results and
embarrassment.

Hello Mark,

I received a windows build via Tom and created a .bmp file with the structure (with MSPaint, save as .bmp, not .jpg). Result is OK (I use Win2000 SP4). My hand calculation closely matches the simulated result.

As long as ground (green color) surrounds your structure completely, results are OK. If not (for example a real microstrip line), results are unreliable.

I will make the line and check the VSWR with 50 Ohms termination.

Best regards,

Wim
PA3DJS
www.tetech.nl
when you remove abc, the address is valid.

Thanks for your reply No Spam.

I was wondering if you might be able to clarify some points that you made.

1) Since I will be feeding the antenna via 300 ohm feedline, transforming it down to 75 ohms (coax) to eliminate noise and then transforming it back to 300 ohms, could I not just take one leg of the output of the transformer and connect it to the External antenna connector on the back of the radio instead of the whip? and then connect the other leg from the transformer to the ear jack ground. and then finally ground the radio via the GROUND connecter on the back of the set.

2) when you refer to to the ear jack ground, are you referring to the ground of the headphone jack. Is this the same point as the GROUND connector on the back of the radio or are the two points different?

Thanks again

> Where are you Elmers buying your baluns?

you have coax? split one end, connect center conductor to one wire, shield to the other. wind a bunch of turns (there is a web site somewhere with numbers) around a piece of pvc pipe, and voila, instant balun. you want to pay for off the shelf stuff, expect to pay for the ferrites that can handle 1500w all the way down to 160m, plus construction, packaging, shipping, and marketting... that stuff is more expensive than the rest of the antenna.

want to be even cheaper? use twin lead, connect it directly to the wire and run it down to a tuner that includes a balun... do it all in one place with less loss.

First John I stated right up frount "by this weekend"
Secondly divination is practiced on this group. How else can say they
don't understand it but
it won't work?
I now have to detail every step in a physics form not only to educate
the perceived experts but at the same time bring them up to par
with the physic that I espouse. At the same time I will supply antenna
program inputs
that will give an answer of 100% efficiency which is unknown to those
who use planar
designs for antennas where the answers are only approximate.
Ofcourse there will still be the naysayers
who say it is all bulXXXX but this time I am hoping for some more
intelligent
people to come forward that can follow known pats of physics.
For you I will tryand make a quick start so you will have some reading
matter
for tomorrow and complete construction for the week end. Aren't I a
nice guy?
Art

John, I will give you some things about antennas for you to ponder
upon
or to google for the answers.
Why is the skin depth not on a a piece of aluminum that you buy in the
store?
Why do people have difficulty in identifying the "weak" force?
Einstein failed
and Feynman is just guessing with his "w" vector.
Where do the charges go on the surface of a fractional wave length
vertical
when the charge reaches the top of the antenna?
Why are antennas all straight when the helix antenna do the same job?
How can you get more gain from a vertical antenna that is not at right
angles to the earth"
What method did the early masters of electricity and mechanics use to
ensure that a
subject was in equilibrium?
John, these points and many more will be answered on my page with
known facts that confirm.
Start googling now so you can get a feel for things when the page
comes out plus seeing a
computor program for 100% efficiency radiators and not just close
approximations.
Surely such things will tickle your curiousity about radiation which I
will divulge which
has never been provided to the world of physics..... until now!
Art

Price the 20 or 30 feet of coax to wind the balun (choke) and it may be
cheeper to buy a balun.

I don't see wasting time or money on a balun for just a simple dipole .
Sure it may make the patern vary from the normal textbook, but who cares
most of the time. Most people have to put the antenna up wherever they can
and lots of time it is not in the desired direction anyway.

NOw a beam or some other antenna design is differant.

The version I have, which I sent to Wim, is 4.6.0. I'm not sure about the differences, but if anyone is interested, I have it in a zip file I can send. The zip file is encrypted, so it will pass through at least some of the email filters that take out executables or zips with embedded executables; I'll supply the password of course (just my call...).

Cheers,
Tom

My S350DL has unbalanced, 500 ohm antenna terminals on the back; I
would imagine yours to be the same.

A 1:1 balun (balanced-to-unbalanced) at the dipole and coax (75 ohm) and
a 6.666:1 UNUN (unbalaced-to-unbalanced) between the coax and the S350DL
would be the ideal setup.

Oh chit, it is folded dipole, duh!

A 1:1 current choke and forget the slight mismatch!

Actually, that is in error. Since the folded dipole is balanced and the
500 ohm terminals on the receiver show they are unbalanced, the 1:1
balun should suffice. It seems you will be going from 300 twinlead
(balanced) to the 500 ohm terminals.

450 ohm feedline with a 1:1 balun is yet another option ...

>> folded
>> dipole) with a design feed point impedance of 300 ohms.

We can only presume this 300 Ohms comes from a resistor, otherwise an
antenna does NOT present one impedance across all frequencies; and not
even across the bandwidth around 10% of 1 frequency.

>>The S350 DL
>> only has an unbalance high impedance external antenna point and a
>> ground
>> on it. How can I attach the T2Fd to the S350Dl and acheive a good
>> impedance match.

This begs the question: "Why do you want a match, when you have
already inserted a resistor that absorbs the power?" Another
question: "A match to what?"

>> 1) Is the whip antenna on the S350DL a low impedance feed point (i.e.
>> 50
>> or 75 ohms)? If so, could I use a 4:1 balun at the feedpoint of the
>> T2FD to convert the feed line to 75 ohm coax (which would be
>> unbalance
>> line now) and just clip the center conductor to the whip and the
>> sheild
>> to a grounding rod?

This would presume a match to the resistor on the T2FD. However, is
the receiver a 75(50)Ohm input? 50 Ohms source Z is a convention of
transmitters, and specified as so; but it is not always a given for
receivers' input Z. Some literally supply the 50 Ohm resistor

internally and at the gate or base of the input transistor. The gate
or base is functionally a much higher Z, but the necessity of bias and
other considerations sets this characteristic to something lower (but
may still be quite high).

Hence, without knowing this characteristic, you maybe discarding your
effort.

>>
>> 2) I could use 300 ohm ladder line to connect to the T2FD but the
>> problem is that the S350DL does not have a balanced esternal input
>> point
>> on it.

Being a "tilted" antenna, it will NEVER be balanced either!

>> I guess what I am asking is what would be the best way to couple A
>> 300
>> ohm T2FD antenna to a Crappy Radioshack S350DL receiver and achieve
>> reasonable impedance matching.

I think what you are asking is can you improve performance - matching
be damned. A receiver demands much less attention to this as there is
usually excess capacity in gain within it.

>> On HF, matching imp for receiving should not make much difference
>> give-or-
>> take a few 100%
>>
>> I suspect whip antenna is high imp. ~2k and unbalanced. You would need
>>
>> to make a one2one or four2one matching xformer placed near the radio
>> with
>> ladder line coming from antenna. This will stop common mode noise from
>>
>> entering your radio via feedline.

A matching transformer is not always a choke. A choke is not always a
matching transformer. A choke reduces common mode currents, but it
has to present an impedance that is in excess of the impedance of your
input (still little understood). Chokes and transformers do not
reduce noise without also reducing signal - UNLESS that noise arrives
from your home, and travels into your receiver through the inherent
imbalance of the system. A choke WILL aid you here, but it won't cut
down on the crackle of tropical storms.

Every major amateur radio dealer I have bought from had baluns in their inventory, Ham Radio Outlet and Amateur Electronic Supply, to name two.

However, you might find a wider selection from
http://www.radioworks.com

My last purchase was from HRO, about $25 for a 1:1 to use with a wire dipole. Go to www.hamradio.com, enter balun in the search box and step through the offerings with Adobe Reader.

Many hams will recommend you try a home-made balun, multiple turns of coax cable wound neatly around a cylindrical form. Exact requirements and effectiveness may vary with frequency and the antenna as installed. You might want to look at http://www.qsl.net/ta1dx/amator/broadband_baluns.htm. (It bothered me to see the letter W used for "ohms" in two places. I didn't spot any other errors/typos but ...)

Oh, that reminds me of a radio call I heard on a VHF Marine radio. Bunch
of happy young drunks offshore on somebody's Dad's boat, lost at night, in
the fog off Dana Point CA.

NOBODY knew a whit about navigation. Asked the USCG to come get them.
CG radio op said he could refer them to a commercial tow outfit for big
bucks.
They figured it out.

Very often, those are the same people who complain of "poor conditions" and "noisy bands", and operate in constant fear of causing RFI. Many of these problems are simply due to common-mode feedline currents bringing RF back into the shack and coupling into the mains wiring.

In other words, people with limited antenna opportunities are often the ones who need a balun - or more accurately, a common-mode choke - the MOST.

The problems of desperate antenna locations cannot be entirely cured, but they *can* be improved. Almost always, feedline chokes and/or baluns will have a valuable part to play.

>NOw a beam or some other antenna design is differant.

The largest difference is in the attitudes of the users. No matter what your antenna is, or where you're forced to install it, it all comes down to one simple question: do you want to give this antenna the best possible chance to work correctly... or not?

You could try holding the pole vertical and let the whole lot drop a
few feet so that the base falls onto a hard surface (assuming it has
some sort of bump cap on the base).

This inertia and rapid deceleration usually releases even the most
stubborn joints.

I have used these poles a lot, and the 'bump' method usually works for
me. Start on grass to cushion the blow, and gradually increase the
impact force until the joint comes free.

Twisting usually does not work, though a little soapy water and heating
might help.

Be very careful about using any kind of wrench or vice jaws, as these
thin-walled poles are VERY vulnerable to crushing. On the other hand,
I've never damaged one by end-on impact.

The problem with ugly baluns is their limited frequency
ranges. In the following measurements, the choking
impedance was over 1k ohms for only small ranges of
frequencies, 19-29 MHz, 10-22 MHz, 16-25 MHz, 8-16 MHz,
5-8 MHz - frequency ranges of 2/1 or less. HF covers
a 10/1 frequency range.

I have. It split the tubing just below the locking area. The problem is that there are many types of locking mechanisms. You need to know what's inside and how it works before applying the traditional brute force.

For example, some poles use external compression or cam type locking mechanisms:
<http://www.telescopingpoles.com/specs.html>
<http://www.briarwoodproducts.com/newtools.htm>
These do not jam and will respond properly to the inertial hammer (brute force) disconnect method. However, they add width which is often undesireable.

Internal locks, with expanding cores, cams, or wedges are a different story. To prevent collapse, most become tighter when loaded in compression, especiallyl those that take advantage of a slight conical taper in the tubing:
<http://www.google.com/patents?id=78duAAAAEBAJ>
<http://www.google.com/patents?id=fvc5AAAAEBAJ>
<http://www.google.com/patents?id=i2ZMAAAAEBAJ>
<http://www.google.com/patents?id=_hMBAAAAEBAJ>
(Look at the drawings). Banging on these internal locks will jam them only worse.

I couldn't find a picture of the inside of the common window washer fiberglass pole. It has partial threads molded into the fiberglass. 1/4 turn to lock. Bang on that design, and you'll split the tubing (like I did).

This mast is smooth all the way, no cams, locks, etc. The tubes must be "slightly" tapered such that as you pull one out of the other it locks in place by sheer friction.

I have tried heat on the outer, cooling the inner tube and considerable twist/pushing force with my hands to get the stuck sections to unlock, all to no avail.

Yesterday I resorted to applying some Teflon Lubricant (Tri-Flo) to a stuck joint but it would still not budge. Maybe today when I go out to the garage the lubricant may have seeped its way down in to the junction.... will try again....

Hate to toss the thing as junk, but its not looking very positive so far. It was a cheap "flag / banner" type import so at least I won't be out as much as a quality unit would have cost me.

4.6.0 is the latest version which fixes the multiple dielectric
problem. I believe this version is had multiple processor support
removed since the author had problems getting it running properly.

Where did you get the Windows build from? My work colleague was the
last one to supply Dr. Kirkby a windows build which was ver 4.4.4. It
would be great if you could give Dr. Kirkby the latest windows build
so he can post it.

>Many hams will recommend you try a home-made balun, multiple turns of coax
>cable wound neatly around a cylindrical form. Exact requirements and
>effectiveness may vary with frequency and the antenna as installed.

I saw an interesting talk at a local ham-club, at which the presenter gave an explanation for one reason that the "effectiveness may vary" with these sorts of choke baluns.

The common-mode impedance created by many such chokes is primarily inductive (below the choke's self-resonant frequency, at least).

The impedance of the unwanted current path (e.g. from the antenna feedpoint, back along the outside of the feedline, to the transceiver chassis or to the point at which the coax is grounded) will depend on the frequency and the length of the coax. It'll have a resistive component (from loss resistance and from radiation resistance) and will usually have a reactive component as well... either inductive or capacitive.

If the feedline-path reactance is inductive or near zero, all is well... the choke balun's inductive reactance will (if sufficiently high) block most current flow along this path.

On the other hand, if the feedline-path reactance is capacitive, and happens to be close in absolute value to the inductive reactance of the choke... then you've got a series-resonant circuit. The two reactances will largely cancel, the choke will "vanish", and you can actually have more current flow back along the feedline than you would without the choke.

If you change the length of the feedline, the choke's performance can get better, or worse.

His prescription: if you want choking that's going to be effective at a wide range of frequencies and won't be sensitive to the feedline length, you need to use a choke which will introduce a significant amount of resistive loss into the choked path (but not, of course, into the differential path that feeds the antenna). The usual solution is a ferrite.

Yes Jim he can. But if he does will frost heaves likely destroy it.
When I was younger I spent a lot of time building duct banks and they
were always built with the base of the bank below the frost line so that
the formation of ice in the soil during a hard winter would not destroy
them. Remember that even a ground ring composed of straight wire is
buried a minimum of thirty inches deep. The objective in constructing
grounding electrodes is to get them down below the permanent moisture
level well into the so called water table.

I know that the subject area is Texas and the strata he's dealing with
is quite hard but he didn't seem to be asking how to install what looks
like an electrode but rather what will function as an electrode.

This is one reason why an ugly choke only works well over
approximately a 2:1 frequency range. Below that range,
the inductive reactance is too small and above that
range, series resonance defeats the purpose.

I don't think so. Such tapered devices have an irritating habit of
collapsing. There's usually some manner of locking mechanism, usually
activated by twisting.

Any way to look inside and determine the type of mechanism? If you
don't have a handy x-ray machine, perhaps a strong light will show
something.

Could you disclose the maker and model number? If there are any
patent numbers listed, that would be helpful to determine the
mechanism.

> I have tried heat on the outer, cooling the inner tube and
>considerable twist/pushing force with my hands to get the stuck sections
>to unlock, all to no avail.

You don't want to heat the outside. That will cause the outer tube to
expand, which will increase its compression on the inner tube. You
want to cool both tubes causing both to contract. If you can remove
an end cap, pour in some ice water.

> Yesterday I resorted to applying some Teflon Lubricant (Tri-Flo) to a

Well, that might help if you can get it into the joint. My guess(tm)
is that it will cause the uncoated parts of the joint to swell, which
might increase its grip. If you must lube the joint, perhaps
penetrating oil would be best.

Did you try the rubber strap wrench(s) idea? That should give plenty
of torque to rotate the sections.

Ah, OK; I thought from the atlc website that we'd just all be on our
own to do it. I'm an analog guy; I enlisted the help of a digital/
software friend. He had no trouble building it to run in a DOS
shell. I'll drop David a note, letting him know that I have it, to
see if he'd like it there.

Cheers,
Tom

Hi

Thanks to everyone that responded.

I am a little confused but this is most likely my fault.

So i will simplify the question.

How could I transform from 300 ohm balanced antenna to 300 ohm unbalanced line without using coax. I will do the transformation right before the balanced (one antenna and one ground connector) on the S350DL.

I think that all I need to do is come off the T2FD with 300 ohm Twin lead and then into a 1:1 balun that does not use coax inside it but a ferrite choke. Does this sound right? If so, then my next question is DOES anyone know how to build a 1:1 balun not using coax to transform 300 ohm balanced to 300 ohm unbalanced?

Thanks again

If you heat a ring of material, both the OD and ID increase in proportion. This loosens, not tightens, its hold on an inner object.

I recall from freshman physics that if you heat two concentric rings made of the same material (having a positive coefficient of expansion), all dimensions increase by exactly the same proportion. A little geometry shows that any gap, even microscopic, between them will therefore also increase proportionally. Cooling both objects of course has the opposite effect, reducing the size of any gap and tightening the fit. Heating the outer one and cooling the inner one, as Ed did, gives you the best of both, increasing the ID of the outer tube and decreasing the OD of the inner tube.

I did this with an aluminum torus way back in college daze. You're
mostly correct. The O.D. does most of the radial expanding, but there
may be a small amount of expansion in the I.D. depending on the
compressibility of the material. If the material is soft, the I.D.
will shrink slightly. If the material is hard and incompressible,
then the I.D. will expand slightly. This illustrates it fairly well
(for incompressible materials):
<http://hyperphysics.phy-astr.gsu.edu/hbase/thermo/thexp2.html>

What I'm counting on is NOT the change in radius cause by a change in
temperature. I'm looking for a slight change in length, which with a
taper, has a somewhat similar effect on releasing the jam than a
radial change. In that case, the inner taper shrinks, while the outer
taper lengthens.

>I recall from freshman physics that if you heat two concentric rings

Apparently, I'm not the only one having problems with the concept.
See:
<http://www.eng-tips.com/viewthread.cfm?qid=99646>

>Heating the outer one and cooling the inner one, as Ed did, gives
>you the best of both, increasing the ID of the outer tube and decreasing
>the OD of the inner tube.

Maybe. If the ID of the outer tube does not change with temperature, then heating the outer tube is a waste of effort. If the material is sufficiently incompressible, then it will expand slightly as you suggest. I'm not sure how fiberglass reacts as it depends heavily on the glass weave pattern and composition. If the pole bends, it may have some compressibility.

Drivel: If the surface roughness is more than the heated or cooled radial expansion of the tubing, it may still remain stuck.

After stuffing myself with a near-terminally fattening ice cream, I
realized that we may be talking about two different types of masts.
I'm thinking of a telescoping mast, where each smaller section fits
inside a somewhat larger diameter section. Kinda like a telescoping
metal whip antenna (i.e. rabbit ears). However, there are also masts
made of equal diameter tubing, with some sort of coupler at the ends.
Your initial posting clearly said "telescoping" but I'm wondering how
one makes a self supporting telescoping mast without an internal or
external locking mechanism.

Which type to you have?

Not as stated. Ferrite is a material, the line running through it
becomes choked because of that material.

>my next question is
>DOES anyone know how to build a 1:1 balun not using coax to transform
>300 ohm balanced to 300 ohm unbalanced?

Stuff the (insulated paired) wires through the ferrite bead/torus/tube
just like you would a coaxial line. Total length of ferrite (a
combination of about 40-60 beads or equivalent) on the order of a
foot. A large torus can support several wraps through it to the same
effect.

Thanks folks Got me curious about adapting this to 1296, or 2404 MHz for quick and dirty antenna to use in contests! tho its an interesting design, by the time you create this, feed this, and with the loss's envolved, probably NOT worth the effort! An interesting use of PC material, non -the-less ! Maybe the Log Periodiotic is less critical to Board Xc, and Spaceing, then other antenna types? But, then the (stripline) feedline loss's alone would probably cancel any gain from the antenna. Again folks , thanks!
When I start thinking- it gets Dangerous out there!

Bear in mind that the impedance of multiple turns is proportional to the square of the number of turns. So 5 turns, for example, through a single core gives you the same impedance as 25 cores strung along the line.

That's a fair point. From what Ed did (and did not) say, I was assuming his pole had a simplest kind of tapered friction lock... which turns out to be so. These often can be freed by end-on impact when twisting doesn't work and squeezing might crush the thin walls.

But even so... hitting something with a hammer shouldn't always be condemned as "brute" force. Sometimes it *is* the most intelligent thing to do.

==========
Black tie wraps contain carbon black and are hence UV resistant and
almost last forever.

Coloured or non pigmented plastic will indeed deteriorate due to UV
radiation.

Polypropylene rope , for example ,is usually coloured but never black.
Reason : If black it would not deteriorate due to exposure to UV ,hence
it would last far too long and the manufacturers would only need to
produce a fraction of their current production.
That's commercial life.

If you use rope other then polyester (sailing boats etc) try to find a
black plastic variety (not easy).
My 40 ft mast has (blue)polypropylene guys which need to be replaced
every 8 -9 years (even here in northern Scotland) ,but it is cheap
compared with polyester rope.

Something that fooled me is the way Amidon specifies
"one-turn" impedance for beads in their brochure. Their
"one-turn" for beads is a wire running through the center
hole, wrapped around the outside, and back through the
center hole. (I would count that as two turns and
would say one-turn is just a wire running straight
through the core.)

As a result, for their FB-77-5621 bead, for instance,
they specify 270 ohms per turn. If one simply threads
these beads over RG-58, the impedance is about 1/4
of that amount, i.e. about 67 ohms per bead, requiring
about 15 of them to get to 1000 ohms.

As Roy says, ten turns of coax on an FT-240-77 core
is roughly equivalent to 100 FB-77-5621 beads strung
over coax.

Interestingly enough, Amidon specifies "one-turn" on
an FT-240-77 core to be 76 ohms, obviously a different
kind of "one-turn" than that of the 270 ohms for an
FB-77-5621.

Yes, '1 turn' on a torroid is 'once through the centre'. For any coil to
work as an inductor, there must be a return path somewhere. For a
torroid, this has to be 'around the outside'. As the permeability of the
core is generally much greater than that of air, it doesn't matter much
whether the wire is close to the surface of the ferrite, or very slack
indeed. With a single turn, the return path could be quite circuitous
(literally).

Very cheap plain fiberglass tubes, slightly tapered so that as an inner tube is pulled up in its outer tube, the taper reaches a point of great friction. Incidently, the tubes on the outside are all coated glossy smooth except for a couple inches at the bottom where the inner and outer tubes meet.... raw fiberglass has great friction coeficient, apparently.

Also, I suspect my problem is that the extended mast was left out in the rain a week when it rained a bit and water got in the joints causing swelling?

There is no make / model number on this. Its a cheap generic made-in-China flag banner pole for RVers, etc.

I managed to loosen one of the frozen connections, but the two others, one of which I tried the lubricant are yet to be unfrozen.

I have a strong feeling that the use of those rubber type wrenchs would simply apply enough torque to the tubes to fracture them.

I am letting the stuck sections sit in my garage in hopes that eventually they will dry out on the inside and then perhaps I can get them unstuck with further application of hand pressure.

I may stuff myself with terminally fattening ice cream, too, while waiting..... :^)

My thanks to all who have provided suggestions, etc.

I suspect you knew if I ever found my Born and Wolf after my
move, you would be in trouble - and you are.

You previously said that Born and Wolf did not agree with
Hecht, but they do, contrary to your assertions.

Their equation for irradiance (intensity) agrees with Hecht.

Itot = I1 + I2 + J12

where J12 = 2<E1*E2> = 2*SQRT(I1*I2)*cos(A)

On page 258 of "Principles of Optics", by Born and Wolf,
4th edition, they label J12 as the *interference term*,
contrary to your assertions. (Hecht labels that term I12)

I probably should make that point a bit "more clear."

A race of aliens a mere few hundred years ahead of us would be difficult
for us to discern from Gods.

A race 1000 years, 10,000 years, 100,000 years, 1,000,000 years,
100,000,000 years would probably, most likely, be GOD!

Sorry I should have said "white tie wraps as shown on the website".
Black tie wraps dont last forever, they still get brittle and break
just from being in the sun. I wouldnt use them either unless they got
regular inspections. I tie wrapped coax to an antenna mast down in
Florida about 5 years ago and they are breaking. No doubt they would
last a lot longer in Scotland.

==========
As a (presumably) radio 'amateur' you could have made your 'invention'
available under a General Public Licence , like the GPL applicable to
open source software (ref Linux)

The number of people now making a good living by developing open source
software under the GPL show that personal benefit and sharing can go
hand in hand.

Well, I have never met "a new energy source" either. Does this mean I
can now dismiss all possibilities and go out into the world preaching
that all sources of energy have now been discovered and we are doomed?

Funny, where I come from, logic just doesn't work like that ...

At least you are able to wrestle with your own logic.

Believe me, I have already intuited that you believe in the "religion of evolution", as opposed to a religion believing in a God.

It is obvious, at this point, one has only two religions to believe in:

1) A thinking mind created "all."

2) ALL spontaneously came into being.

The first requires a belief in God.

The second requires a belief that living organisms (or, biological "machines") can spontaneously come into being, and that the elements in the universe can spontaneously come into being from a space composed of "absolute nothing."

On close examination, an intelligent would most likely deny the possibility of either.

However, it is obvious one is correct ...

Why any one individual would choose one over the other, with no proof being available, is simply a function of human nature ... then, for someone having chosen one over the other, to ridicule the other possibility--well, that is simply insanity!

Occams' Razor is clear on which would be chosen ... the aliens, at least for the short term explanation ...

I have not heard of that. I have always shared my work with amateurs
even tho
it makes you a target for naysayers and loudmouths. But to give out
how one can make a
an efficient small antenna before it is cleared by the patent office
puts a lot of money at stake
and with the sunspot activety at it's lowpoint it does not hurt to
wait a couple of months which extends time for loud mouths to spew.
Cheers
Art

Just because God knows how everything will turn out, doesn't mean our choises are of no value.

I don't know where you are getting your ideas, but since the subject is changed again:

I would like to see a new energy source. I have some doubt I will find it on YouTube, but those chances are greater than if I built it out of my junk box. Such things will likely come at great expense. My solar experiments only account for a small percentage of my electric usage but I have managed to cut my gas bill drastically. Some could argue it is the oldest energy source out there. Everyday we are bombarded by a whole lot of energy that just heats up the roof. I have cut my bill by simply putting to use the energy that would have only heated up my roof or my South side.

The point is we should all be thinking about such things rather than expecting some government "fall guy" to fix it for us by digging deeper into our pockets for "party money". What we have when we foist our responsibilities on the government, are big screwups by people who are too removed from the problem to have a hope to fix anything by throwing money on scam artists. The Castro government comes to mind as a perfect example. Just throw money at the government and it becomes fat, and lazy and a burden to those who see a need and fulfill it. The job of a President should be to inspire rather than shoulder incessant ridicule that cripples our nation's credibility in the world. Those who ridicule should stop and provide some useful input or shoulder responsibility themselves rather than hoping for disaster to vindicate their bad attitude.

If we ever do find a race of aliens, I would hope we would hear from them by radio first. There is no reason to think there couldn't be, but if they were close enough for it to matter, we should have heard from them by now.

Unless they consider on-off keying (or radio in general) to be obsolete, beneath them, and hate everyone who uses it because they won't waste their time learning it, then look out.

Since our subject is still baluns, I have used Fiberglass tape on Torroids and solenoid windings because they heat up. Other things deteriorate. I use that because I have some. I couldn't tell anyone what would be best in the long run for UV. It is a big problem. Heat means loss. I prefer to do

away with the need for baluns and other elements that don't contribute to radiating the energy.

Go to a larger core, stack large cores to lower power density per cubic centimeter of core material--adjust core material to compensate for increased inductance, etc.

Proper functioning of the balun hinges on proper design/material, of course ...

Now is one is designing an electric heater, ni-chrome wire might be implemented in the design--perhaps a "ceramic tape", etc. ... 8-)

A little dry humor
Fantasy isn't harmfull unless we base conclusions on it.
> >
> >
>
> Believe me, I have already intuited that you believe in the "religion of
> evolution", as opposed to a religion believing in a God.

Wrong. You are correct though in characterizing evolution as a religion.

Evolution theory functions as centerpiece of some wonder, but there are
glaring problems: No evidence of missing links in the face of Tons of
fossil evidence of a great variety of unique species (notwithstanding
sub-species that are obviously related). Evidence suggest that species
would have had to spontaneously come into being en masse from extreme
outbreaks of very specific mutation. Creation would make more sense than
that because mutation overwhelmingly is a deterioration resulting in a loss
of viability. Additionally, Life even in what we would consider simple
one-celled organisms are in fact highly organized and cooperative
communities of seemingly intelligently flexible or single purpose
mechanisms. None of which would survive without the viability of the whole
organism. So which came first, the chicken or the egg? Neither could have
been viable or accidentally come into being on their own. Then where are
the fossils of the supposed transitional species. We know there is some
flexibility within the species for adaptation, but new species are a great
leap over a nonexistent bridge. The evolution theory was actually based only
on observations and wrong conclusions and even Darwin thought to abandon it.
It might not have survived to this day if it were not commandeered for it's
political value to justify revolution, genocide and a notion that in order
for an idea to be viable, all others must be destroyed. The notion that
apes transitioned into humans is more farfetched than if we were evolved
from ferns or fruit flies, if we were to compare the DNA structures. Today
we have youth wearing "natural selection" T-shirts going on shooting sprees
and random gang killings for tatoos so don't tell me about evolution.

OK, essentially GOD or No GOD.
>

It is obvious that life operates with great intelligence despite our
conscous will, so we have that much proof of intelligence although not much
of it comes to our awareness with that much regularity.

So Aliens created the universe? Occam's Razor is only an expedient. It
only works for simplicity's sake and calls us to make assumptions where our
understanding fails. The scientific mind would ponder and record the
evidence allowing for lack of understanding rather than summarily executing
God, or constructing explanations simply to deny God. All too often I see
experiments that are discredited because the results cannot be
satisfactorily explained by the answer sought. A belief in God should not
be such a problem for those who don't believe unless their wicked nature
makes it so.

Then couldn't the same be said of all recorded history
where the witnesses can no longer be cross-examined, ruined, executed?

I more subscribe to the theory that witnesses who died defending their own observation, are more compelling than those who would have written for any other reason. Also that witnesses may not have fully understood all they heard or saw, but reported because it was noteworthy. This also lends to credibility, because those with a hidden agenda usually restrain themselves from presenting testimony that doesn't contribute to their argument.

There is more evidence to support much of what is recorded in the Bible, than required to convict someone of Murder. I would suggest a book by Lee Strobel, "The Case for Christ" as a method to ordering and initiating their own logical investigation. In the end you will have to be open to the Holy Spirit before anything can come of it. Salvation comes by invitation only. My own conclusions came when I realized the teachings of Christ were the only hope of saving the human race from it's own self-destruction. Further, that it could succeed against the odds.

This would be profound, if it weren't coming from an "anonymous"
source replying in other side threads to an "anonymous" source.

Two such "anonymous" sources in a series of dialog is very much less
than compelling and lacks all reason.

I simply prefer not to attract tons of V-agra spam. These newsgroups are seriously mined and my actual e-mail address associated with this login is set to dump all mail because of that.

The truth speaks for itself. You can come up with any excuse to deny it.

BTW Gustav is picking up strength

Hi Richard,
Both sources need the tinfoil changed on their respective
hats. They also need to find a newsgroup where they can discuss popular
theology without danger of being withered by ridicule from the other
participants.
73,

I have transmited in the clear here for the past 13 years.

Since May, I have received all of 2 spams - from the son of Charles
Taylor in Africa. The amount of spam that predated that is of like
proportion.

>The truth speaks for itself. You can come up with any excuse to deny it.

In those same 13 years I've often heard the same excuse you are using.

Anyone who is willing to quote the Bible, but refusing to testify is
obviously of little faith - a Xerox can do as much and "anonymous"
sources lean on that copy button freely without conviction.

You will have to forgive Richard and allow for his limitations ...
without a personality to attack, he is like a fish out of water.

Unable to form properly formatted text to argue text on its' merits
alone, you will frequently encounter these "dead ends" in exchanges with
him ... undoubtedly, you will learn to adapt.

I use an ugly balun with an attic GRrV and do not suffer significant back-RFI to my transceiver in the regular frequency ranges. I think that by chosing 1Kohm that may be a bit conservative. In (old) engineering school, we tended to use an order of magnitude (X10) as our highly arbitrary :) cut-off point for impedances that have a significant effect. You are doing that too but by using 1000 ohms, you are using (X10 times 2) as your arbitrary cutoff point. Since the filter is an exponential curve, if you chose 500 ohms instead of 1000 ohms, you might even get a 4 or 5 to 1 frequency range. In my case I use two different turns chokes so that is why I think I am covered pretty well. Your information is very interesting; good to see people are actually measuring things!

Technically I would have to disagree with calling even a 1:1 balun the
same thing as a common mode choke. A CM choke is an EMI prevention
device intended to filter out RF components generated in a circuit,
away from the feed of a power source, usually an electrical mains. A
balun is intended to change the feed from an unbalanced transmission
line to a balanced output, for example, for connection to a balanced
transmission line or to an antenna such as a dipole. With the balun,
we wany NO reduction in RF current flow. I agree that the effect is
the same, semantically, ie one side effect of the use of a balun is
less CM interference from coming down a balanced feedline but it is
there for a different reason.

While "mutation" can often be detrimental, we have to determine if you
define mutations as genetic variability. Is a person who is efficent at

storing fat a mutation as compared to one with a fast metabolism? Natural selection selects for that efficient person in times of little food.

Organisms that have become more complex do depend on that complexity.

> So which
> came first, the chicken or the egg?

Now this is the zenith of science!

At any given time since "chickens have come into existance, they just lay eggs, and more chickens come about. If there was some way to pinpointa pre-chicke, the egg would be the first part. The pre-chicken hatches the first chicken. But it doesn't work that way.

> Neither could have been viable or
> accidentally come into being on their own.

That is the supposition of the answer.

> Then where are the fossils
> of the supposed transitional species. We know there is some
> flexibility within the species for adaptation, but new species are a
> great leap over a nonexistent bridge.

So, are you saying that every possible fossil has been discovered?

Where did all those animals go anyhow, and why are not modern men's fossils in the earliest stratum?

> The evolution theory was
> actually based only on observations and wrong conclusions and even

Citations please?

> The notion that apes
> transitioned into humans is more farfetched than if we were evolved
> from ferns or fruit flies, if we were to compare the DNA structures.

Wrong. Humans did not descend from apes. We did not evolve from apes.

It is exceptionally difficult to make a rational argument when the same old LIE is repeated over and over again.

> Today we have youth wearing "natural selection" T-shirts going on
> shooting sprees and random gang killings for tatoos so don't tell me
> about evolution.

Are you serious? Quite the non-sequitar.

>> It is obvious, at this point, one has only two religions to believe

>> in the universe can spontaneously come into being from a space
>> composed of "absolute nothing."
>
> OK, essentially GOD or No GOD.

If you are serious about this, you are listening to the wrong people. There is no reason that a god could not create a universe in which every singel evolutionary concept would appear as we have seen. This god could also create every being as wildly different in structure, different cellular metabolism, or even more effective, create everything as sacs of goo with no perceptable means of "living" but living none the less.

>> On close examination, an intelligent would most likely deny the
>> possibility of either.
>>
>> However, it is obvious one is correct ...

Wrong. There is the third possibility that something created the universe and the life in it, and allowed it to go it's way. If it eveloved fine, if not, fine.

> It is obvious that life operates with great intelligence despite our
> conscous will, so we have that much proof of intelligence although not
> much of it comes to our awareness with that much regularity.

>>
>> Why any one individual would choose one over the other, with no proof
>> being available, is simply a function of human nature ... then, for
>> someone having chosen one over the other, to ridicule the other
>> possibility--well, that is simply insanity!

Different folks have a different definition of insanity. You have so many wrong suppositions in your beliefs, such as evolution as the beginning of life - it makes no such claims. The no transitional forms - there are

plenty, and more showing up all the time. The idea of irreducable complexity as you point out in your earlier cellular part. Many of the things that are presumably too complex, such as the human eye, can be shown to have many present day light sensing processes that run the gamut from simple sensing, to rudimentary lenses, to the human eye, to those of raptors.

To qoute oft repeated and very wrong precepts is disingenuous at best. In extreme cases, it starts to look as if a person is "lying for God". And he doesn't like that!

If one were to tear apart a mud hut, and then a state-of-the-art
building, he/she would only find the basic building blocks are more
similar then dissimilar ... most likely, 99%+ of the elements in the
state of the art building can also be found in the mud-hut ... I see no
reason why someone should expect different in the basic building blocks
of life.

First there is a prototype, then improved designs, and at some point in
the future, or far-far-future, a finished design (maybe.)

We are all looking at the same "evidence" alright, the crux of the
matter is in the interpretation(s.)

Vast differences John. Were not talking about bricks here. We're talking about a skyscraper in Hong Kong and the hut is one of it's droppings. Vast difference in design and complexity but both would be sufficient to be viable in there own element. Mud huts are not strong or expensive but stay much cooler without any kind of power or energy. The mud hut will not evolve into a Hong Kong skyscraper no matter how long you watch.

Were talking about complex molecules that do specific jobs and drive complex machinery. Think of a cell as a city with numerous factories to make it self sufficient. DNA decides not only how the factories will be built but what factories are needed and how they will all interact to make the cell self-sufficient, and some of the factories will be build only as needed from parts from other factories that are deemed surplus as they too can be rebuild as necessary. All the Plans are in the DNA but how does the cell or any part of it know when or what plans to consult and who or what redraws the plans as necessary. Still the DNA is very specific in what capabilities are available so that the fly cant grow a human foot or the frog won't grow a hoof. The DNA is limited only to minor changes. Any more and things needed to survive aren't there. Splice too much and the different parts fight each other.

Now consider that all members/parts/factories/roads/power/lights/political parties in the system have to work together and if one part is out of place the system crashes and the organism never happens.

Here is another puzzlement. It seems that the difference between Man and Woman are that one end of the structure is slightly goofed so that between the woman and man several traits are either activated or not. Other than that they are the same structure. But how can you say that one is evolved differently from the other?!? With out the difference, the species would never have been so it could have nothing to do with evolution, leading one to expect a spontaneous event {*POP*} where both could continue as one flesh so to speak as there would never have been time for an evolutionary change to allow them both to evolve into a viable species.

Consider this: One translation says "You formed me even in the womb from the lower parts of the earth" Or to that effect. could the translation as easily be designed and programmed elementally in the womb. Certainly fits what is actually happening, but what does a sheppard boy know of DNA?

Water worked ok for me and I replaced the Steel pipe I used with a
clad ground rod after I made the "hole". Now on the job I see
electricians using a neat tool. I think Milwaukee makes it. It
attaches to the rod and hangs off the side and appears to be able to
be clamped on anywhere and hammers it into the ground. Seems to work
very well under different conditions. Try rental houses first. If ya
belong to a club it would be a good club buy.

I lost your context then. The only thing in common between the skyscraper
and mud hut is that they have a maker and some plan. Maybe some wood. If
you are talking Chemistry, then you are getting specific and I doubt they
use the same mud formula in the skyscraper anywhere but in the flower pots.
The only thing
in common with various different species are proteins, and they aren't
even life. I contend that the complexities involved are too astronomical to
be accidental because outside of minor adaptability that are wired for,
changes from one species to another couldn't happen one step at a time, it
would be just as probable if male and female of a species popped out ready
made. You cant make a semi out of a VW bug without recycling and
redesigning it from the ground up.

> You argument contains more your agenda than rational debate in a quest
> for answers... colleges are constructed just for such purposes--to
> educate you in the differences ...

There is no place for rational debate on this subject (and many others) in
most colleges. It conflicts with the agenda to promote Globalism, Marxism
and
homosexuality, and especially the denial of God, national unity, or any
authority above the Global Socialist state. Karl Marx was a seminary
student when he stumbled onto Darwin's book. After reading it, he lost his
faith and went to formulate his own theories of life and revolution. Hitler
also read Darwin's book and made references to it in Mein Kamph and other

works to justify ridding the world of "inferior species" in order to promote evolution. Darwin became an Atheist because he couldn't bear the thought of his Father going to Hell for committing suicide and sought to promote Atheism. Interesting to note, several of his children had birth defects.

I present this in the context that Darwin promoted:
1. That all life on the planet evolved from mud and through slow evolution,
2. All species evolved from a single celled organism that evolved spontaneously from mixtures of "primordial ooze" and inevitably,
3. There is no god, no purpose in life but to be killed and eaten by another organism.

In fact, there is no more proof of those ideas, than of the idea that a great
number of species spontaneously emerged over a short time and make environmental changes within the limitations of the DNA and viability.

However, since there is no research money for God, the Darwin theory persists because the alternative is unthinkable.

That is too far narrow a definition of a "common mode choke",
especially the reference to electrical mains. The term is widely applied
to transmission line for both digital data and analog RF signals.

>A
>balun is intended to change the feed from an unbalanced transmission
>line to a balanced output, for example, for connection to a balanced
>transmission line or to an antenna such as a dipole. With the balun,
>we wany NO reduction in RF current flow.

What exactly do you mean by that?

And also, what exactly do you mean by "balanced" in the context of a
feedline?

>I agree that the effect is
>the same, semantically, ie one side effect of the use of a balun is
>less CM interference from coming down a balanced feedline but it is
>there for a different reason.

Not in my station. My motivation for using common-mode chokes is
specifically to control any incoming and outgoing interference that
may be caused by common-mode currents on the feedline.

When the common-mode component of the feedline is reduced, it will also
be accompanied by an improvement in "balance" on the antenna, because
the two things go together (or at least, they do for some definitions of
that word). But "balance" is never my primary goal because I don't find
the concept helpful, either when deciding what to do next or when
evaluating the results.

Iron is iron, whether in a pure form, alloys, rust or other ferric compounds. Silicon is silicon, whether in a window pane, silicon oxide, or some other compound of silicon. Calcium is calcium, whether in limestone, cement, earth, or other calcium compounds, etc., etc. ...

Back when I was in college, someone did some computations of how the body of Plato would have decayed and been dispersed throughout the world in the thousands of years since his death. They arrived at the conclusion that everyone on the planet would have at least 6 molecules from Platos' body in their own bodies (mostly water molecules since that is the major component of the human body) ... I cannot verify the accuracy of those computations--however, you get the drift--I am part Plato! <grin>

Hmmm, playing, "I am taking the high road game, huh?

Ok. Well, here is my favorite version:

Fee-fi-fo-fum
I smell the blood of an Englishman.
Be he alive or be he dead
I'll grind his bones to make my bread. -- "Jack the Giant Killer."

Now, one sure to be your fav:

"Child Roland to the dark tower came,
His word was still, Fie, foh, and fum,
I smell the blood of a British man." -- Shakespeare, "King Lear."

And, for those finding neither to their liking:

"O, tis a precious apothegmatical Pedant, who will find matter enough to
dilate a whole day of the first invention of Fy, fa, fum, I smell the
blood of an English-man". -- Thomas Nashe, "Have with you to
Saffron-walden."

Ahhh, remember the good-ole-days when you could write this
gooble-de-gook for yourself? A burden which has now befell my
shoulders--I only thank God they are broad (my shoulders of course, not
the women!) :-(

However, Shakespeare does seem to befit some as more appropiate
"trolling lines" than myself ...

Regards,
JS

A common mode choke is used in RF applications, very true, but it
serves a filtering purpose,
not a conversion of unbalanced to balanced energy transfer or vice
versa. A common mode choke that operates well will turn
unwanted RF into heat or cause it to dissipate in its core or a
resistor etc..

You do not want the balun to operate hot (ir to dissipate heat as you
do with a CM choke filter). You strive for 100% transfer of energy and
settle for the best
you can get. With a CM choke, you try to filter and dissipate unwanted
back-RF. Any back RF from your balun
should be converted to unbalanced transfer back to the source. You
reduce back-RF by matching impedances (which can also involve baluns
but not the 1:1 application discussed here). If you try to filter it
the unwanted back-RF, you will also end up filtering the forward
energy transfer. Of course, that would be an undersirable situation.

>
> And also, what exactly do you mean by "balanced" in the context of a

> feedline?

For a 2 conductor feedline, the V in each conductor is 180 degrees out
of phase with each other. Same with I. One conductor is +90 degrees
and the other is -90 degrees with respect to earth. At any given
instant and location the summation of both conductors with respect to
each other is equal to the magnitude it would be on the inner
conductor on the unbalanced (coax) with respect to ground (shield).
Since magnitude of the V on each conductor of the balanced line are
equal and opposite in phase, the term "balanced" is appropriate. Same
with I.

> may be caused by common-mode currents on the feedline.

Of course. But it is not due to filtering unwanted RF, it is due to
the conversion of balancing your energy so
that the coax properly acts as a shielded unbalanced line with no
energy in the shield and all energy in the inner conductor
(assuming perfect conditions). Your dipole will try to balance when
fed as a dipole directly from a coax.. Without the balun, any
reflected energy will
partially come down the shield to ground causing interference. The
balun simply unbalances the reflected energy, if any, to that it all
returns through
the inner conductor eliminating RFI if the radio and the shield are
properly earthed.

>

> that word).

But think of your dipole as a balanced transmission line. That's what
it is, with a lot of loss (into radiation resistance).
You WANT common mode on THAT that lossy transmission line and you do
not want it filtered away.

But "balance" is never my primary goal because I don't find
> the concept helpful, either when deciding what to do next or when
> evaluating the results.

I say "balanced" is your primary goal though you do not realize it.
You want to balance the energy propagation in your dipole "lossy

transmission line", when feeding it with an unbalanced coax. The balun should accomplish that. Anything reflected is not good but at least it is reflected "unbalanced" inside the grounded shield causing less EMI.

The manufacturer of your antenna may be KLM (SK). I sniffed this out:

http://lists.contesting.com/_towertalk/2007-11/msg00259.html

Some KLM products rolled into M2 Antenna Systems
http://www.m2inc.com/index2.html It doesn't look like M2 offers any antennas fed through sleeve baluns or sells any sleeve baluns separately.

Also, I have a two 440 beams with the closely spaced "lattice" configuration of multiple driven elements -- as you described. They are fed through quarter sleeve baluns. 16/17 cm long, cut on an angle at the open end, if it matters. One of the baluns still has the mfr sticker on it. Would you believe "KLM"? I could post a picture.

From this, I suspect the feed point impedance is close to 50 ohms. I mention impedance only in passing, as I encountered some references to impedance transformation through half-wave sleeve baluns. I haven't investigated that aspect.

I googled for "sleeve balun"and at first glance, this looks OK.

http://www.vhfman.freeuk.com/radio/sleeve.html

Making your own sleeve balun looks easy enough. However, I saw more than the "normal" share of weird s**t on the 'net about making sleeve baluns. Sleeve baluns are good -- don't misunderstand. Just be careful. Read a lot.

Multiple toroids slid onto the coax also form a balun. IIRC, advice was posted here recently regarding fifty toroids for HF. Could be that toroids also work well for VHF. Others will know. Good luck and report back.

> same thing as a common mode choke. A CM choke is an EMI prevention

I suggest that a reasonable definition of a balun is any device that facilitates or assists transition from unbalanced to balanced mode of operation. That definition permits a wide range of devices that may have characteristics suited to specific applications.

(Keeping in mind that an unbalanced feedline is often not ideal in application, ie one where common mode current is exactly half of the differential current, and a two wire open line is often not ideal in application, ie where common mode current is zero.)

Most people naturally think of balance in terms of voltages wrt some common reference, eg ground. It is equally legitimate, and often more appropriate to the antenna / feedline scenario, to seek balance in terms of current, ie to minimise common mode current.

Owen

Common-mode chokes, and filters in general, do NOT aim to "turn unwanted RF into heat"! That is a total misunderstanding of the whole concept.

An ideal common-mode choke would dissipate zero heat energy, and a successful real-life choke will dissipate only a tiny fraction of the available RF power.

When you insert a common-mode choke, you are inserting a large impedance into the pathway of the common-mode current. The RF current distribution throughout the entire antenna/feedline/ground system will adjust to take account of this new impedance. As a result, most of the common-mode current will be DIVERTED away from its former pathway, and will flow instead in the antenna.

The details are complicated, but the concept that the choke DIVERTS common-mode current away from the feedline is reasonably accurate. (By contrast, the concept that it "turns unwanted RF current into heat" is just plain wrong.)

If the choke is doing its job, the new value of common-mode current (I_cm) flowing through the choke will be much less than the previous

value. The power dissipation in the choke will then be (I_cm)-squared x R, where R is the resistive part of the choke's impedance at that frequency. Note that I_cm is the small amount of common-mode current that remains *after* having inserted the choke - not the value before! The practical outcome is that a higher choke impedance will give *lower* heat dissipation in the choke itself.

If a common-mode choke is getting hot, it isn't working. Unfortunately there are many chokes that don't have a high enough impedance to handle the full range of real-life situations. If a choke is not able to suppress the common-mode current to a low enough value, then in some situations it will get hot [1, 2]. But PLEASE don't imagine that is how common-mode chokes are intended to work!

Sorry, but that is so confused I can't even begin to unpick it... except by pointing to "you try to filter and dissipate unwanted back-RF". In so many different ways, that is NOT what we're trying to do. Tug on that loose strand, and the whole thing unravels.

Yes... but this definition of "balanced" also REQUIRES that the
common-mode current is zero. The two are locked together, so if
"balance" is your aim, the practical way to achieve it is to force the
common-mode current to a lower value.

We have some direct leverage on common-mode current, because it's a
real, measurable thing. But "balance" is only a concept, and there isn't
any *direct* leverage that we can apply to it.

So even though a "common-mode choke" and a "current balun" are two
different names for the same physical device, it does make a difference
which name you choose. Think "common-mode choke", and you can see the
levers that will make your antenna/feedline system perform the way you
want it to. Think "balun", and all you see is a label that covers those
levers up.

[...]
>But think of your dipole as a balanced transmission line. That's what
>it is, with a lot of loss (into radiation resistance).
>You WANT common mode on THAT that lossy transmission line and you do
>not want it filtered away.

Again, that is all so misconceived - at every turn, it clashes with
obvious, measurable physical reality; or else it contradicts itself.
I'm sorry, but you really do need to do a clean wipe and start again
with a good textbook.

What do you want? A new book of the Bible? How's this for testimony -
I must be a thorn in the side of the devil or he wouldn't have been trying
to take me and my dad out all our lives. The Lord has delivered me over and
over and even set a table before me in front of my enemies. My dad now
rests in Jesus. My rest is yet to come. Maybe if I was a poet or a
songwriter I could add to the Psalms but I leave that to others with that
gift.

I have often considered the Good Cop Bad Cop theory of the Rep - Dem scam on the people. The fact that they go to the same parties and get-togethers means they share the same thoughts. It doesn't mean there is a conspiracy per-se. Think of it as one big party that everyone has to go to or be left out, and even though everyone goes kissy-kissy, they are knifing in the back. Distrust and polite smack is all around. Rather than conspiracy though, there is convergence in thought on matters brought to light to be wrestled over while more important matters are forgotten for the moment. We the People get left behind.

Who do you vote for though... Obama has been hanging around the Rev. kill whitey bunch for too long. No telling what disease he might have picked up. There also seems to be some overcompensation, the way he so desperately needs to validate himself with every group that he forgets who he is from day to day. By the same token, what damage was done to McCain while being thrashed in the POW camp. But he does seem to have tolerance and compassion even though he sticks to his guns.

The fact we are narrowed to two parties smacks of some kind of collusion. Especially in the light of certain travesties of the Dems that the Reps are curiously silent on. Perhaps McCain is so attractive due to the fact he has proven to be less of a party lapdog.

A CM choke aims to present a high impedence to unintentional RF. Once
"choked" by the high impedance,
the enrgey must either reflect or be aborbed somewhere in the circuit
or the core as real power. What is it that you cannot
understand about the term "choke"?

>
> An ideal common-mode choke would dissipate zero heat energy, and a

CM choke is a filter, not an energy transfer device. Do you have any
formal education in electrical engineering?

Whew. You sort of describe a balun except that the balun is an
impedance matching device, in this discussion 1:1.
What new impedance does your 1:1 balun change you transmission line
and antenna feedpoint to ;-)

>

Strawman. I didn't say that! RF current or voltage at the antenna is
not unwanted. You are the one who says you use a common choke choke at
your antenna feedpoint, not I.

I cannot believe you are serious. You actually insert a choke at your
antenna input? I insert an efficient balun ;-)
Have you ever thought that there might be a reason for people
differentiating the use of a balun by use of the term "balun"?
There is a reason. On paper, it looks the same as a balun. In
operation, the CM choke presents a high impedance to
unwanted RF where the balun presents a MATCHED impedance to
intentional RF.

>
> If a common-mode choke is getting hot, it isn't working.

It is working quite well if the filtered RF is dissipating in the
intentionally lossy core. (Such as powdered iorn).

Unfortunately

Umm, we do not want to reduce power from the transceiver to the
antenna?

It sounds like you have reached the plateau of your ability to
understand RF and transmission lines. THAT is the reason for
you confusion. Sorry.

except

Continue the metaphor. Tug on that loose strand and what do you
discover, thus unraveling what?

Yes it does! This reveals a large part of your confusion. The shield
on the coax is at earth. Earth is always involved. Do you know that
you could connect an earthing point exactly half way down the
"balanced" winding of the balun and have no effect on the operation of
the balun? There is no reason to do that of course but it illustrates
what the balun does. The center portion of the balanced winding is an
isolated 'earth' connection (that does need to be isolated but it is).
One side is -90, center is 0 (earth) and the other side is +90. On the
unbalanced side, there is no phase shift of course; you only have 0
(shield) and inner conductor voltage/current.

In a perfect situation, with a balanced feedline, the only kind of
current and voltage you have IS common mode!

I give up! You need some education in this area.

When Martin Luther King got them to promise, "OK, we are going to cut you in on a piece of the pie ..." They suddenly kicked open the doors on immigration from starving/impoverished 3rd world nations and added the words, to the above, "NOW, grab yourself a piece of that pie!"

"That is 'IT', in a nutshell." However, there are whole books which would could be written to fill in what the above doesn't mention.

Many have good reason to fear Obama. If he cuts in his friends, relatives and people of his like color, ethnicity and background(s), we are all in for "sharing a piece of our pie!" And, we all know it has to happen, we were just hoping to put it off and let our children deal with it (like deficit spending, where we have put off our bills for our children to pay.)

Now, that is enough, I am done with this sub-off-topic-thread ... you will excuse my leave ...

My take on CM chokes is that they are best on TV coax to keep energy on the shield from bringing trouble to the TV chassis. On a transmitting antenna, the idea is to enforce a high impedance bump somewhere to set the resonant length other than what it wants to be. That might not contribute to efficiency even if it prevents the coax from being part of the antenna. If the antenna is in resonance, there won't be any coax radiation and no Choke is really needed. My point is, you are best not needing one, but if that is what you need to put the current out on the wire, or out of the shack. OK. Of course high gain antennas have a pattern to protect, but does it matter all that much for anything up to a 3 element yagi? High currents and voltages on the coax are to be avoided because that is where your loss will be.

Most likely, KLM (formerly owned by Mike Stahl K6MYC , out of business, last heard) And feed Point is 50 Ohm, Balanced (Unless you also have the 1/4 wave Balun. The Insulators for the elements, are no longer available (I Tried to obtain some several years back), and may be brittle (might want to reinforce them with Epoxy) the feed point of these was at the element closest to the center of the antenna (boom). These, if remember were based on the Oliver Swan Patents (he also used log periodic feed point in his basic antenna, tho think Swan only made them for 6 meters-- as info, Jim NN7k

Actually, 1000 ohms is pretty liberal. For instance, on
15m, the G5RV coax sees 36+j230 ohms or about 233 ohms.
The balun needs to be 10x that value or 2330 ohms.

Actually, I have heard this argument(s)/discussion(s) since a very early age.

I see no conflict between me having complete free choice and the ability to control my destiny exactly as I see fit, or change my mind to fit me--right along side an all-knowing mind who has already seen every decision and change of heart I will have in my lifetime (the future is there for me to discover and make my decisions to influence--but he/she/it/the-aliens has/have already "been there, seen that!" ...)

What am I missing?

Well, "Grain Spirits" exist outside my mind (and body), until I drink them--then suddenly, I feel like I am "FILLED WITH THE HOLY SPIRIT!"--well, if I drink enough anyway ... ;-)

Obviously, in the above, that "HOLY SPIRIT" was not originally there, so it had to be outside, somewhere! :-|

Remember, "Holy" and "Grain" both have the same name. Most likely come
from the same lineage; they might even be brothers!

Some ancient text from the bible I once read, if I remember correctly,
said something akin to, " ... take a little wine for the spirit ..."
Obviously a toast to one, or both, of those brothers!

I have a lot of space available for antenna installation and i am wondering if installing a 4 or 8 wavelength antenna would provide increased performance or problems. For instance, instead of a 120 ft dipole for 3900 khz a 480 ft or 960 ft.

I would be installing across a valley so ends would be about 25-30 ft off the ground and the center would be about 80-90 ft off the ground.

Thanks

I would connect a feedline to the mounting screws of the front most DE and measure the SWR. If you get anything like 4:1 it is 200 Ohms. The KLM 6m beam with 2 driven elements requires a 4:1 balun. I have not seen the KLM 2m.

According to an old AES catalog, 2m KLM antennas in this range had boom lengths of 15.33, 21.5, 12.9, 28 , and a circularly polarized 22 element on a 19 foot boom; nothing with 12 elements, but it could be older.

Wouldn't help efficiency, but would alter the pattern. Being you may
well
need a matching device, I don't see much point unless you want gain in
certain directions.
You would want to model the antenna on the various bands to see
how the pattern would look.
On the higher bands, you might be better off feeding as a longwire
rather than a dipole if you wanted gain.
But beware of static buildup, etc.. Ground the wire out when not in
use, and consider a gas tube or whatever. A friend of mine ran a
longwire years ago when he was a novice. You could often draw a
good sized arc to ground if conditions were right.
Anytime you get gain in certain directions, you lose gain in some
other directions. So on 75m, I generally prefer as omnidirectional
an antenna as possible, while maximizing system efficiency.
But I'm usually talking to more than one at a time, in various
directions. I want to avoid nulls. I just use coax fed dipoles on
75m.
A turnstile, if I'm feeling fancy. That's what I've had for that band
here at
the house for the last few years. I started using those back in the
80's, and it's still about my favorite antenna for 75m NVIS type
stuff.
BTW, if you did decide to string out a lot of wire, you might also
consider a flat loop. Again, you would want to model it for all the
bands
to get an idea what it would do.

Yes and I have to partially take back what I said; a balun CAN double
as a CM "choke" and a CM choke can double as a balun. If
one wishes to balance an unbalanced line with a CM choke, then the
impedance of the CM choke must match the source and the load, which
makes the CM choke a balun and no longer a choke :-)

Why not 500 ohms, assuming a 50 ohm source and transmission line?

The pattern looks best for a 960 foot wire. Feed it a the end with a quarter-wave (or 3/4 wave) open wire or ladder line and use a tuner. Be prepared for some lossiness in the feed in wet weather.

It should actually be fairly good for DX off the ends.

Well, we are now focused on the crux of the matter, alright.

However, I see him/her/it/the-aliens only being able to view the after effects of my free will ... in my speculation(s) of how-this-all-works, of course.

I see the mind of God as having similarities to my own (man created in Gods' image--it is most difficult for me to see it any other way.) He would not conduct an "experiment" in which he controlled all action; the reason? Too boring. The variable is my freewill which provides the seed-of-chaos, however, one piece of equipment in "his laboratory" allows him to view the final outcome(s), and ahead of me experiencing the same.

But then, I have nothing to argue against the way you would envision it ... can we agree to wonder until some point in the future offers a proof worth extrapolating from?

Or, in other words, the only horse I have in the race is curiosity of "the truth."

The common mode impedance of the balun acts in the common mode
transmission line (which is mutually coupled to the nominal radiator).

How is the differential mode transmission line characteristic impedance
relevant to the determination of common mode current in the antenna
system scenario described?

It's a trivial point, I agree, but there is one error in the url JS provided above that needs correcting. The VK author tells us that the Windom antenna was invented by Loren G. Windom. Tain't so. It was invented (developed) by William Everitt, then the Dean of the EE Dept at Ohio State U. Everitt was doing the grunt work and taking measurements along with another OSU professor. However. Loren Windom was a student of Everitt's, and was tagging along and observing. Then, later on he wrote up the experiment and had it published in QST sometime in 1929, and as well as I can remember, he failed to give Everitt any credit for having done the actual work. Consequently, readers of QST assumed it was Windom's invention, while it actually was not.

Now I realize that some of you are non-believers, so for you this is an exercise.

It's would be pretty arrogant to consider that you have the ability to screw up God's plan. We can't even be sure that Satan screwed up God's plan, but it appears that there is some contention that is/was/does exist in the heavenly realm.

Now consider that he allowed your being to come into existence perhaps for a purpose. OK that is implied in scripture.

Now consider that you don't know what your future is even if God pre-ordained it. If you did, what good would it do you and wouldn't that influence your choices? Only Jesus was in on His future from the beginning and knew how his life would play out and even tipped off the Disciples piece by piece throughout his ministry. Even told them in real time what was happening as it happened and how it was foretold in earlier scriptures by the profits. This shows him to be familiar with numerous events in time and how they play out together and the significance. It has been postulated in a regular radio series that the Bible is a sophisticated messaging system outside of our time domain planted by God to relay information about our past present and future to future generations.

Now consider that Moses negotiated with God over who would do the talking to Pharaoh and God relented and let Arron do the talking while Moses did the signs. But God revealed to Moses how Pharaoh would respond and how the whole scene would play out. That's a real mind blower. This shows that some could actually have been doomed while some obstinate and sinful people could still negotiate some things with God and even make bad choices, although risking serious consequences for some of those choices.

So were left with this:

God's plan won't be usurped, but we can petition Him with prayer over some points. This leads us to another possible conclusion.

Perhaps there are parts of his plan designed to allow for us to make a variety of choices despite his intention for us. So you DO have free will even if he already knows how you will choose. It has been stated by Jesus that He came so that none should perish but all could come to repentance, have life everlasting, have life abundantly and other statements to that effect given the shortcomings of language. This implies that we really DO have choices even though it doesn't quite make sense unless Jesus really did make a change where someone like Moses' Pharaoh could now have a choice. It also allows the possibility that if one missed an opportunity, there could be an infinite number of others that do his will anyway.

I don't like to delve too deep into this because there is a lot to learn bit by bit and we run risks by jumping to conclusions beyond our understanding. I merely note some interesting points from Genesis, Exodus, Matthew, Mark, Luke, John. I'm not much for citation of scripture and verse because I believe context is far more important than throwing one liners at people.

Doesn't that article espouse the Guanella 4:1 current balun built on a
single toroid?

The extent to which such a construction works is due to flux leakage,
rather than the principles described by Guanella.

==========
With so much space and assuming you talk dipole ,if you make each half
of the dipole an odd number of quarter wave lengths ,the impedance at
the feeder connecting point would be low.
Then you can either have a coax feeder (with 1:1 balun at dipole centre)
or a twin feeder preferably but not necessarily having a (electrical)
length of half a wave length or a multiple thereof resulting in a low
impedance at the matching box (tuner if you like) .

Actually, a balun without a large choking impedance
is not very useful for ham antenna system applications.
The method that a W2DU balun uses to balance currents
at a dipole feedpoint *IS* nothing more than a large
choking impedance which discourages common-mode current
from flowing through the higher-the-better impedance.
I usually refer to the W2DU balun as a choke-balun.

Be the current making a choice of paths at a junction.
How much of you would flow through 500 ohms and how much
would flow through 233 ohms? (If 500 ohms is the total
impedance seen by the shield current looking back toward
the source, about 1/3 of the current would flow back
through the 500 ohms down the coax.)

Would it increase 'performance' or just cause problems? Probably
both. The performance increase may or may not be present when
compared to what you're using now. Problems? You can bet on it.
Mechanical ones mostly. What conductor will you use that will hold up
it's own weight at 480 or 900 + feet? And since there will be 'sag'
no matter what you use, will the end points be high enough to keep
from 'clothes-lining' yourself on the antenna? Certainly not
impossible to put up such an antenna, but not exactly as simple as it
sounds.
- 'Doc

Owen:

You might have missed this part from the Windom URL:

"As far as the forward power to the antenna is
concerned there is no ferrite core. This is
because we have transmission “through two
transmission lines”. There is no external flux
around transmission lines. However if the
antenna is unbalanced there will be leakage or
common mode current flow through the
balun. These currents are not transmission line
mode currents. These currents will see a
choking reactance presented by the balun and
be stopped or significantly reduced. These
leakage currents if extremely excessive can
cause heating of the balun (but you have
probably got a serious problem that you need
to fix). Very high SWR can cause voltage
dielectric loss and even flashover between the
windings. Again this would indicate a more
serious problem with the antenna."

I should think a single core would be superior in relation to the above
stated phenomenon. Indeed, I suspect it to be preferable to two cores.
However, if such "leakage" is occuring, the author indicates you have

a problem with the antenna proper which needs a fix ...

However, this URL:

http://www.n0ss.net/qrp_4-1_guanella-type_balun.pdf

in the include pick 4-1_schematic.jpg, in the URL, contains a "blurb" on how to move a single core design on to two cores.

Regards,
JS

I'm slightly encouraged that the key word "reflected" has now crept into
your description. It wasn't there in what you wrote previously.

[Snip similar]

>In a perfect situation, with a balanced feedline, the only kind of
>current and voltage you have IS common mode!

What??? You know that statement didn't come out right, so how much of the rest did you really mean?

>I give up! You need some education in this area.
>

I give up too - at last, something we can agree about.

My main worry is that anyone *else* might have tried to gain some education from your confused statements on this particular topic.

Here is an article which includes text on the use of ferrite rods in
place of toroids.

Someone who has a couple of rods from some old am radios, etc. may
already have the stuff in his junk box to throw together an introductory
prototype?

There ya go.
One of the problems of breaking up the path to ground on the shield is that now static can build up. If you can provide a way to bleed off the charges that build up on both halves, while breaking up the shield currents, now you have made it worthwhile. But when you guys start discussing off center fed dipoles, I step aside. I have computers in the shack. I have better luck with fan dipoles. Also running a Butternut vertical. Works a lot better than a 4btv, but a pain to get it right on all bands.

Thanks

Also liked the other pdfs presented. I never have time to read them all because of constant interruption around here. Back to work.

Product Features and Technical Details
Product Features
Dual-network Blackberry for access to Verizon's CDMA network in the US, and GSM networks when travelling abroad
Fast 3G access using Verizon's EV-DO data network; GPS for VZ Navigator turn-by-turn direction service
Bluetooth for communication headsets, MicroSD memory expansion up to 4 GB, integrated digital audio player
Up to 220 minutes (3.7 hours) of talk time, up to 216 hours (9 days) of standby time; measures 4.5 x 2.6 x 0.55 inches (HxWxD)
Includes: handset, rechargeable battery, travel charger, international travel charger adapters, USB cable, VZAccess Manager CD, printed documentation, quick start guide
Dimensions

Size (LWH): 4.49 inches, 2.28 inches, 0.77 inches
Weight: 5.31252204585538 ounces
Product Features

Network Compatibility: CDMA

Product Description
With the BlackBerry 8830 World Edition smartphone, you'll enjoy fast, clear communication from Verizon here in the United States as well as seamless voice connectivity as you roam the globe. It's the first CDMA BlackBerry smartphone capable of roaming globally on GSM/GPRS networks, so you can travel the world with full mobile voice and data coverage without having to change smartphones, phone numbers or email addresses.

This sleek and performance-driven smartphone has been redesigned with trackball navigation and a new backlit QWERTY keyboard. It also offers support for Verizon's high-speed EV-DO data network and built-in GPS so you can take advantage of Verizon's optional VZ Navigator turn-by-turn direction service. And it continues to offer all the communication features that you've come to expect from Blackberry smartphones, including email served up by the BlackBerry Internet Service and a full menu of messaging options (SMS, MMS, and IM). Other

features include Bluetooth for communication headsets, MicroSD memory expansion up to 4 GB, and an integrated digital audio player.

Product Description
Adding a fashionable touch to Research in Motion's formidable arsenal of telephonic, PIM, and media tools, the BlackBerry 8320 Curve for T-Mobile is also the smallest, lightest BlackBerry phone that includes a full QWERTY keyboard. This amalgam of the svelte BlackBerry Pearl and the more business-oriented 8800 combines RIM's long-valued corporate email and messaging platform with a host of advanced multimedia features, including a 2-megapixel camera and stereo Bluetooth (for listening to music via wireless headphones). In addition to its quad-band GSM and EDGE connectivity, it also offers Wi-Fi connectivity for access to the Internet and email as well as access to T-Mobile's Hotspot @Home service.

OCF antennas were not fully appreciated by me, a few of Cecils' helpful insights and encouragement and I built one and was rather surprised ... I do not have one right now but that is only due to neighbors/property constraints.

Here is a URL for design/implementation of "non-standard" baluns/transformers, but of a highly useable and desirable nature--or, Dr. Sevick strikes again!:

http://www.highfrequencyelectronics.com/Archives/Nov04/HFE1104_Sevick.pdf

Fig. 6(A) is very interesting. A 5-winding, 1:1.56 bootstrap transformer which provides 50/75 ohm connections/substitutions. Perfect for allowing one to use 75 ohm "junk" (or found in dumpsters) tv coax in place of more expensive 50 ohm coax.

I have made good use of this since I have thousands of feet of NEW 75 ohm coax I purchased from a scrap dealer for next-to-nothing! A lot of large dia coax and hard-line mixed in!

Regards,
JS

> Do it! See what happens.

For that length, I imagine you would need multiple supports along
the way to deal with the sag. Of course, you could use real light
gauge
wire to reduce the tension needed to sag, but then the first real
storm that comes along and it will be most likely toast and he will
have to do it over again.
Unless there is a real need for the directive gain, I'd tend to avoid
the
real long wires.. Can be more trouble than they are worth, considering
I can use a yagi and be able to steer the thing at will. With a wire,
you are stuck with one or two directions, depending if terminated or
not.
I've considered running long wires as a beverage receiving antenna,
and even it can be prone to damage after a while with all the trees
whipping in storms, etc.
But at least the usual beverage is low to the ground, and fairly easy
to install and repair if needed.
Long wires can be interesting, but I would not want them as an
"everyday" antenna. I'd always have the standard dipoles, etc for
everyday use. I might play with a long wire, but it would be an
"extra"
antenna used more as an experiment.
Being there is no real efficiency advantage to using extended dipoles,
the only reason to really consider one is if you want some gain in
certain directions. Being that there will be directions where the
gain is less, and you can't control the pattern, any advantages
would be totally up to the user and who they work.
It would generally be a disadvantage to me on the lower bands.
I want to be as loud as possible in all directions.. :)
I have used a few extended double zepps with good results, but

that's only .64 wave per leg. Or about 150 feet +- per leg of the dipole. "about 300 feet total". Anything longer than that, and the pattern becomes more X shaped, and the gain is no longer broadside to the wire.
Anyway, to make a long story short, I would not use extended dipoles if it were me building "everyday" use antennas.
I'd stick with the standard dipoles, etc, and leave the long wire stuff as "experimental or DX" antennas. With that much room, seems to me he could have both.

No. I assumed you could find fig 7.1 and see it for yourself. The plot has phase on the X-axis and intensity on the Y-axis. The caption reads Interference of two beams of equal intensity; variation of intensity with phase difference. " At the top of the page: "Let us consider the distribution of intensity resulting from the superposition of two waves which are propagated in the z-direction...."

The relation is useful for precisely the reason I indicated. That is why Heckt also includes it in his book.

I deleted the rhetorical blithering from your post. And again, please quote my remarks directly whenever you wish to discuss them.

Your Freudian slip concerning your feelings about Hecht
is more than apparent, i.e. "To Heck with Hecht"! :-)

One wonders why you said something to the effect that
Hecht had been discredited in favor of Born and Wolf.
When I recommended the 57 page chapter on interference
in "Optics", by Hecht, you said something to the effect
that interference is unimportant, yet Born and Wolf's
chapter on interference is 113 pages long and mostly
agrees with Hecht's writings.

Did you mean a two core design onto one core?

Here is an analysis of the single core version:
http://www.vk1od.net/balun/gsc/index.htm .

Guanella did not show the 4:1 balun on a shared magnetic circuit, and it
is an error on the part of those who think that the two independent TLTs
in Guanella's circuit can be coupled without changing the behaviour
significantly (basically, ruining it).

A little mismatch isn't such a problem. At least if you can get the loss down. I wouldn't even worry about it, the internal tuner would make short work of that. Look out for water damage on that stuff though. Especially the Aluminum braid/foil shield stuff like LMR. Even a little bit of moisture percolates all through the braid.and turns it into aluminum oxide powder and extremely noisy with power on it. It could look brand new and you would keep cutting it back, then find a foot of new braid but keep cutting and its back to chalk. We would routinely assume it bad and throw it away. At least with the Hardline, you can sweep it and put some power to it to check the loss Only hardline allowed on towers.

Let's cut the crap, currents in one winding which cause lines of force in the toroid/ferrite-core, should only assist the lines of force generated in the core by the other winding on the opposite side of the core--in the single core model of the guanella balun--composed of two 1:1s in a 1:4 configuration (or guanella TLT, since you seem to prefer acronyms.) At least TLT get the transmission line requirement out in the open ...

Since toroids naturally demonstrate "economy of loss" in the magnetic lines of force within their structure, few, if any, lines of force would be shared between two separate cores, stacked.

Now, wasn't it Einstein who recommended that things only be made as complex as necessary and not one iota more?--Or, watch out for the gray haired man who keeps attempting to sneak behind the curtains in this train ride though Oz--and KEEP HIM AWAY FROM THE LEVERS! ;-P

For a balanced transmission line, the characteristic impedance is not
expressed in differential mode terms, it IS common mode so I do
not know why you ask about differential mode characteristic impedance.
I never mentioned it. The characteristic impedance of a ladder line
for example
might be expressed as 600 ohms. That 600 ohms assumes common mode
conduction, as charateristically transmitted in a balanced line,
Differential mode impedance is assumed for un balanced transmission
line conditions.

> 73, Cecil http://www.w5dxp.com

I disagree. There is no choking, there is merely a polarity and phase shift between the "primary" and "secondary" of the 1:1 balun "transformer".

The best way I can easily express this is to consider a 1:1 240V 60 Hz isolation transformer (yes, the balun acts theoretically in the same manner). At the unbalanced input you connect 240V on one terminal and earthed neutral on the other terminal. Now consider the isolated secondary each feeding an equal resistive load to the center tap of the secondary (analagous to radiation resistance). Across each load we see 120V, 180 degrees out of phase. This is a balanced transmission. Correct, this is not RF but it illustrates what the balun is supposed to be doing. There is NO choking function at all if it is working properly. There cannot be a choke when impedances are matched, only when they are significantly mismatched.

> 73, Cecil http://www.w5dxp.com

I got confused as to whether we were talking "choke" or "balun". For the balun, you want to be as close to 50 ohms as possible. Actually 233 ohms is not that bad. 1K would be really bad and illustrate that the balun is not working well. It 233 ohms, it is sort of OK, especially with a tuner, which you use with a G5RV anyway, along with the ugly balun. In priciople, the frequency works OK for my G5RV/ugly balun system.

By the way, I have seen so many articles about baluns written by other hams and they tend to repeat the same mistakes and assumptions. Most hams do not understand how a balun works. Some even think you do not need a balun if the antenna is at resonance which is totally untrue. Anytime you feed a dipole directly with an unbalanced coax, the balanced dipole "load" forces current down your ground shield and into your radio and makes your radio part of your transmitting antenna. Inserting a balun does not "choke" the current in the shield, it merely shifts the output phases so that the current (voltage) is directed towards the dipole at all times (see my other post in this thread).

No. But you have focused on your error in thinking/logic/function. An RF Transformers does what you state, lengths of transmission line carrying RF behave in a different "mode." (uh, I hate that word ...)

Now, if you do some research, you can correct your error(s) ...

I would like to make/experiment with a longwire antenna
specifically for the two meter fm band. Is there an optimum length to try &
still keep an omnidirectional pattern? Also the optimum amount of radials
and will i need a matching unit?

1674. Re: Two Meter Longwire Antenna Question

The nice things about VHF and UHF wire antennas is that they can be
easily built and easily modeled with one of the numerous NEC2 programs
available. The short wavelength means that you can generally ignore
ground effects. However, you do have to consider the mounting
structure (i.e. tower) in your calculations. I have no way to answer
your questions as you didn't specify what you're trying to accomplish
or what you have to work with. Optimum for what? VSWR, gain,
radiation angle, pattern, what? Not enough info.

As penitence for this capital crime, you are sentenced to download and
install EZNEC, 4NEC2, or other NEC2 modeling program:
http://www.eznec.com (Free demo is good for simple antennas)
http://home.ict.nl/~arivoors/ (lots of good examples included)
http://www.si-list.net/swindex.html (old list but still useful)
Plug your proposed antenna into these programs, and see what it will
do in the way of pattern, VSWR, radiation efficiency, bandwidth, etc.
Incidentally, the 3D antenna patterns are cool. Yes, you will have to
learn a bit about antennas, learn how to run the program, and learn a
few new profane incantations to get it working. However, I assure you
that it's worth the effort. Once you get something reasonable on the
computah, then built it and do some measuring.

I am guessing that you want vertical polarisation, and omni directional pattern in the H plane (azimuth).

As an end fed unloaded vertical wire over perfect ground is lengthened than about 60% of a wavelength, the low angle major lobe splits and significant power is radiated in higher angle lobes. You probably don't want that.

So, in the sense that a longwire is an endfire antenna, it is not suited to your need for a vertically polarised omni antenna for FM operations.

A 5/8 wave ground plane isn't a bad antenna, and about as long as is useful in a straight radiator. It is an example of a good antenna that is not resonant, debunking the myth that resonant antennas always work best. It does not have a 50 ohm feedpoint, and is reactive, so some impedance matching is needed for 50 ohm line, but it is not difficult.

For higher gain with omni pattern, you should consider a colinear array. They are very popular, but mostly of commercial manufacture.

The R7 doesn't use radials or a counterpoise. It is the electrical equivalent of a 1/2 wave antenna on all bands. That was one of the reasons that it was so popular.

Like the OP, I tend to agree that the problem is in the black box.

There were several articles published on how to restore the black box to original specs. Anyone know of their location?

What about the loss in the balun? You need to decide if the loss in the
balun is less than that you would get if you simply used the 75 ohm coax

direct. And ask yourself 'In my application, why would 75 ohm be more lossy?' Also, with similar physical dimensions, construction etc, 75 ohm coax is slightly less lossy than 50 ohm (current is less, so 'I squared R' loss is less).

Well, there's your problem. In a properly functioning
transmission line, whether balanced or unbalanced, the
currents in the two conductors are differential, not
common-mode. The two currents are equal in magnitude
and 180 degrees out of phase and their fields tend
to cancel which minimizes radiation.

Common-mode currents only occur when the two currents
are not perfectly differential, i.e. not equal amplitudes
and/or not 180 degrees out of phase.

In a w2du balun, zero flux in the beads is introduced
by the transmission line currents. All of the flux in
the beads is introduced by common-mode currents. Thus
the impedance of the beads *IS* a choking impedance
aimed only at the common-mode currents.

My choke-balun is ten turns of RG-400 on an FT-240-77
toroid. It's only purpose is to provide a choking
impedance to common-mode current. That choke-balun
doesn't know if it is being used as a UNUN or as a
BALUN.

Most baluns are designed such that near-zero flux
is introduced in the ferrite toroid by the differential
mode currents. Essentially, the only flux introduced
in the toroid is due to common-mode. The resulting
impedance *IS* a choking impedance.

> merely shifts the output phases so that the current (voltage) is
> directed towards the dipole at all times (see my other post in this
> thread).

This applies to a W2DU balun. Why would you want
differential current fields to be introduced into
the #77 ferrite beads? Their entire purpose is to
provide a large choking impedance and dissipate
common-mode power.

dfinn1@nc.rr.com wrote:
> Many US amateurs do not understand how a balun works.

Quoting "The ARRL Antenna Book" re a w2du balun:
"Maxwell made a test balun by slipping 300 #73 beads
over a piece of RG-303 coaxial cable. The impedance
of the outer conductor of the cable measured
4500+j3800 at 4.0 MHz."

The differential current emerging from the inside
of the coax braid encounters, e.g. 30 ohms, looking
toward the antenna. It encounters 4500+j3800 = 5890
ohms looking back down the outside of the coax.
Ohm's law does the rest.

Without the beads, that differential current might
see an impedance lower than 30 ohms looking back
down the outside of the coax for certain unfortunate
lengths of coax. The common-mode choking impedance
forces ~equal currents in each dipole leg at the
BALanced antenna to UNbalanced coax junction. That
common-mode choking impedance causes the balun
function to occur.

If you increase a single monoples length beyond 1/4 wave, the takeoff angle
of radiation compresses closer to the horizon for a gain improvement. Of
course now it isn't resonant but so what, all you have to do is finish with
a loading coil to make it look like a 3/4 w antenna and it has a resonant
low impedance again. If you increase the length beyond 5/8w though, high
angle lobes begin to appear and the low angle lobes become less intense.

Another way is to stack elements and feed them in phase so that their
patterns reinforce. There is a point of diminishing returns though due to
losses in the matching and feed systems. Commercial base antennas up to
about 10db gain are commonly available. A favorite UHF mobile antenna has

2- 5/8 sections stacked one over the other. Because the 2m and 440 FM sections of the Ham bands are very close to harmonically related, this antenna can be constructed to double as a 2m antenna just short of 5/8 for that band too.

I bought a commercial #9007 KD4BUM vertical for $20 that is 5/8 over 1/4 wave collinear at about 9' long. Works great as the mount is interchangeable with HF hamsticks and CB whips and has quite a bit of gain. It is nothing but a fiberglass pole with #16 or 18 wire that goes up 1/4w then windings for a phase reversal + the matching section for the next 5/8 section to look like 3/4w. Very simple in construction for such excellent performance and still short enough for mobile use.

>In a perfect situation, with a balanced feedline, the only kind of
>current and voltage you have IS common mode!

This statement above contains a serious error of perception while trying to inhabit the debate over BalUns - and it probably corrupts that topic too.

First - a circuit has at a minimum two conductors extending from a source. A circuit by its nature is circular: for every charge carrier that enters it, one must exit it. Continuity is a necessary condition for a circuit. No continuity, no conduction, hence an "Open Circuit."

Second - those two conductors, if viewed at a remote point where they are joined, have equal and opposite paths of current conduction - to and from that point. This is from Kirchoff's law of currents.

Third - this is called Differential Mode current in anticipation of a common modality.

Fourth - if that remote point of connection is replaced with a load, there is a voltage across that load characterized by both the unaltered directions of current, and its now altered magnitude of current.

Fifth - this is called Differential Mode voltage in anticipation of a common modality.

This completes the discussion of the Differential Mode.

If we expand upon this simple model of a source, two wires, and a load and put it into the context of life as we know it; then the circuit operates in the proximity of ground. By convention, ground is called Common.

Ground, by convention is an infinite sink of charge of infinite extent. Hence as a conductor, it is available everywhere - Common. This ground may have either deliberate or accidental conductive relationships to the Differential Circuit.

First - the linkage of ground to the differential circuit can be through an Ohmic path, or by an inductive path, or by a capacitive path. To support conduction, the circuit must contain two conductive paths to ground through any combination of these linkages, and that path must be complete. The apparent source driving conduction through that path will be a combination of the differential source and the differential load as each will have some relationship to ground.

Second - those two conductive paths, if viewed at a remote point where they are joined, have equal and opposite paths of current conduction - to and from that point. This is from Kirchoff's law of currents.

Third - this is called Common Mode current.

Fourth - as the differential circuit is original and establishes both the source and the load; then through the introduction of ground, this Common Mode current is mixed with the original Differential Current and analysis must be performed by substitutions to separate them.

Fifth - the apparent source presents the Common Mode voltage.

This completes the discussion of Common Mode.

The applications of a choke to either circuit is commonplace to control each mode's current. It would appear through the context of discussion in other threads that there is some confusion in what is being choked, and how a choke is properly applied is confounded by that confusion.

It follows that if the transmission line from the source to load suffers from Common Mode currents, that this must be due to a Common Mode voltage gradient extending from the source to the load. If either lead of that transmission line pair were choked, this would disrupt the Differential Mode. If both leads of the transmission line pair were independently choked, this would only double the disruption. However, if both leads were choked in parallel (both lines either coiled as a pair rather than individually, or both lines penetrate a lossy core) then their fields would be contained between them in the Differential Mode, but their Common Mode path (they both share equal conduction in the same direction due to the Common Mode voltage gradient) will be snubbed.

Some BalUns employ these techniques - some don't. BalUns fail by the degree that they don't when Common Mode, as a problem, is injected into the circuit through imbalances. As balance in the proximity of earth and many confounding nearby structures is a forgone failure, choking is a practical necessity for correct BalUn performance. Any issues of BalUn heatings are proof of this choking necessity, and further proof of the demand for additional choking at that point (and frequently elsewhere at wavelength relationships along the affected line).

A 1:1 balun IS an RF transformer. Lengths of transmission line wound
an air core can function as a 1:1 RF transformer. Does this in any way
show you the error you are making? Transformers operate in the same
way whether at 60Hz or RF. So much for your "No" statement which seems
to demonstrate a certain confidence masked in senility.

Nope. The CM choke works precisely because the common mode currents
are mirror images, 180 degrees out of phase. If they weren't, the CM
choke could not act to cancel them and you would need differential
mode chokes to get rid of them. On your balanced feedline, the voltage
at any point is delta between the amplitude of line 1 and 2.

OK, next time I specify an EMC filter for a switching power supply, I will ensure that the CM choke impedance matches the impedances of the network and the loads so that I can most efficiently conduct RFI from the source to the power line, from common mode at the load to unbalanced load of the power line source. This will ensure maximum interference is imparted on the phase conductor. In fact, I think I will change my nomenclature by refering to the "choke" as a "balun" (they are one and the same; the source doesn't know the difference!) and promptly fail my next FCC submittal. Then I will be invited to retire and of course I will have much more time to be re-educated on rec.radio.amareur.antenna.

Because the input and the out windings of the balun must be isolated
at least at RF of interest, OF COURSE there should be a high impedance
between the ballanced current flow and the unbalanced current flow.
However, the impedance of the source looking into the impedance from
the souurce should match source impedance and the impedance of the
load looking in the output winding of the balun should match the load
impedance (say 70 ohms, or 600 ohms or whatever your antenna or
trnasmission line impedance is. The impedence at frequency of interest
between input winding and output winding should be infinity for
isolation purposes (obviously you do not want to mix the unbalanced
input and balanced output currents.

I agree that a balun operating at 14 MHz would be a choke when
operating at 70MHz.

You are 100% wrong. From "The IEEE Dictionary":
"common-mode (1)(general) The instantaneous algebraic
average of two signals applied to a balanced circuit,
both signals referred to a common reference."

The "instantaneous algebraic average of two signals"
180 degrees out of phase is ZERO.

Let me put it this way (again very simplifed): How do you explain a residential 208V power source where you have 120 V from line 1 and line 2 to ground but 240V with respect to each other. You 240V household appliances operate this way. Ecept for the fact that the lines are 120 degrees out of phase phase (insread of 180 because we use a delta system instead of Y, but this is not that important for this discussion) this is nearly a BALANCED feed, where lines 1 and 2 degrees out of phase at 60 Hz and the voltage of interest is the summation of the two lines. Nearly every home in the USA operates this way. In Europe, 240 V is usually obtained by the voltage difference between line 1 (240V) and earth (0V). That is an unbalanced feed. You can insert a 1:1 isolation transformer using the European system at the input and create the balanced USA system at the output by drawing +120 and -120 at from the output windings assigning imaginary isolated earth at centertap. The isolated ground CANNOT conduct tio real ground if the winding to winding impedance is infinity. Basically, hams' 1:1 baluns do much the same thing: They isolate the real ground as such and prevent currents from flowing down the input ground shield. On this ng in a short space I cannot think of a simpler way to express this although I expect to see many statements (you can't equate 60Hz to RF!). Yes you can; a transformer operates as a transformer in the same wayat any frequency providing you design it properly for the frequency of interest. This subject is not nearly so complicated as some in this group makes it out to be and the topic certainly does not rate articles in amateur publications any more than basic application of ohm's law does.

So that means I get 0 volts when I touch one side of the 120V in my
electrical service to the 120V other side? I was afraid I might see
240V.

You would do well to agree that a well-designed W2DU balun
operating at 14 MHz is choking the heck out of the 14 MHz
common-mode current in order to achieve the balun function.

You seem to have the IEEE definitions of differential
signals and common-mode signals exactly reversed. Because
of that misconception, might you be the one who doesn't
understand how baluns work?

If those signals are equal in amplitude and 180 degrees out
of phase, it means they are *differential*, you will see 240v,
and you had better not short them together. OTOH, if they are
common-mode signals, they are in-phase and you can short them
together to your heart's content - no current will flow.

Again, you seem to have the IEEE definitions of "differential"
and "common-mode" exactly reversed in your head.

I was listening to a preacher just last night.

According to him, All is preordinated. God knows the outcome of everything and every single thing that has and will ever happen. All is predestinated. This has been known from before he created the unuverse

Do your prayers make any difference, they really don't, because God knew you were going to pray, and he knew his response. You had no choice. You did what you did because God made you do it that way.

This of course means that God knows the predestination of every person he created, which means that he knew that he was knowingly condemming a whole lot of people to an eternity of torture.

Nice guy.

I wouldn't say it was choking the common mode.mode current, I would say it is isolating it from diff mode current by simply creating an isolated ground reference point (you could define it at centertap if you were so inclined). Of course I would agree that the impedance between diff mode current at the input and CM current in the output had better be very high, infinity would be best, but the finite impedances to load and source respectively should match the balun. If you want to call the ground isolation function "choking", that use of this colloquialism is fine with me but FYI that is not the traditional vernacular for that that application. Also, if the W2DU balun is referred to as the "ugly balun", I do believe the use of a bifilar winding around an air core to create an RF transformer has been around for more than 100 years so I do not understand why it is so-named after a contemporary ham. It is rather simple to go from bifilar enameled copper to using the shield and inner conductor of a coax as "bifilar" conductors. All of this stuff is pretty basic EE (Associate level, not even Bachelors) and I hesitate to spend much more time on it.

Let me put it this way (again very simplifed): How do you explain a residential 208V power source where you have 120 V from line 1 and line 2 to ground but 240V with respect to each other. You 240V household appliances operate this way. Ecept for the fact that the lines are 120 degrees out of phase phase (insread of 180 because we use a delta system instead of Y, but this is not that important for this discussion) this is nearly a BALANCED feed, where lines 1 and 2 degrees out of phase at 60 Hz and the voltage of interest is the summation of the two lines. Nearly every home in the USA operates this way. In Europe, 240 V is usually obtained by the voltage difference between line 1 (240V) and earth (0V). That is an unbalanced feed. You can insert a 1:1 isolation transformer using the European system at the input and create the balanced USA system at the output by drawing +120 and -120 at from the output windings assigning imaginary isolated earth at centertap. The isolated ground CANNOT conduct tio real ground if the winding to winding impedance is infinity. Basically, hams' 1:1 baluns do much the same thing: They isolate the real ground as such and prevent currents from flowing down the input ground shield. On this ng in a short space I cannot think of a simpler way to express this although I expect to see many statements (you can't equate 60Hz to RF!). Yes you can; a transformer operates as a transformer in the same wayat any frequency providing you design it properly for the frequency of interest. This subject is not nearly so complicated as some in this group makes it out to be and the topic certainly does not rate articles in amateur publications any more than basic application of ohm's law does.

Hi Dfinn

I realize that you have asked this question to Richard, who is far better prepared to answer than I am. But, it seems that you are confused about how two sine waves add. Maybe I am wrong, and you do know how two sine wave voltages generated at different times and are connected in series combine to being other than 180 degrees from terminal to terminal.
All the 208 power lines I am familiar with *are* 208 from terminal to terminal when each leg is 120 "terminal to center". Where did you get the "240"?

Actually, NO!

A 1:1 balun is a TLT, as stated, properly, by Ownen ...

But, what you speak of is frequently an RF Transformer ... how you keep repeating that mistake speaks to your in ability to do research and educate yourself ...

Jerry, in the three wire system with 180° phase difference between Line1 and Line2 wrt Neutral (the centre wire) the voltage Line1 wrt Line2 is exactly twice the Line1 to Neutral voltage.

You probably don't use the word Neutral over there, it is the word used for four wire three phase systems and it is equally applicable for a three wire two phase system where the Neutral wire carries the "imbalance" current.

None of this is a good analogy to a two wire open transmission line at radio frequencies, principally because the length of conductors at power frequencies is usually a very small part of a wavelength and can be approximated well using a simpler analytical model than the traditional 'Telegrapher's' equations applied to transmission lines.

Those who resort to explaining radio frequency transmission lines and transformers using 60Hz models need to justify the accuracy / limits of the approximation. The low frequency model does not explain high frequency roll-off in RF transformers and inductors, so it is clearly incomplete.

Almost all of this discussion is using lumped circuit analysis (a low frequency model) to explain not just transmission lines, but conductors with significant mutual coupling (the nominal radiator and its feedline).

Yes, ZERO with respect to the isolated reference point. They are
measured with respect to each other, not ground. No current should
flow through the ground line if the feed is perfectly balanced.

Hi Owen

My post to the other guy evidently read as though I was asking a question. Actually I read the original post as to have errors and was expecting some lanswer to justify how 120 degrees can be associated with a set of only 2 terminals. There is *no* 240 volt pair of terminals available in a 208/120 power system.
Here in "the states" 208/120 refers to a 3 phase system Y circuit. That means there are 3 sets of single phase 120 volt circuits available at the panel. Also available is a set of three terminals that are 208 volts 3 phase.

I found it difficult to go beyond the simplistic 60 Hz analogy in this discussion to best decribe my concept (when writing on usenet). All one can hope for is that the general idea comes out and hope people realize that the variables you mention do exist as well and do not detract from the very fundamental concepts.

You reference line 1 to line 2. You put your RF voltmeter acroos the two conductors. When doing so you measure two times the voltage that line 1 or line 2 reads with respect to an imaginary isolated grounbd at the centertap the line 1 or 2 measures separately with respect to centertap. OF COURSE the summation of all points on the common reference is zero at all locations at all times, that is why it is called an isolated "ground"! That is why I said earlier you could connect the centertap of the isolated CM side to real ground with no effect on the circuit in an earlier post.

Cecil, if a transmission line operated in the way you think, it would be radiating fields all along its length transmitting RF all along the length of the line. Nothing would get the antenna. The conductors in the lines MUST carry mirror image currents and voltages to indeed cause the cancellation of fileds you speak about. THAT is how energy gets to the antenna. Ever hear of a ground loop?

I am not sure where you are coming from. Are you trying to say that differential mode interference often exists alongside CM interference and diff mode can be filtered by coiling phase wires over a ferrite core? Works for me. I agree. Now, what has that got to do with the discussion?

I in all honesty think I remember seeing a circuit years ago for an
emergency dummy load that was identical to Arts design for an antenna.
I am fairly sure it was one of my uncles books from the Navy as he was
a radio operator during WWII. If anyone else remembers something like

this I woul like to know of it.

Jimmie

I tried to explain this one failure in my model; it is truely of phase difference of 120 degree, thus you get only 240/SQRT(3) = 208 RMC when measuring from phase 1 relative to phase 2. The cure is to imagine a Y network instead of a delta network; it is much easier to conceptualize but they are not used so much in the US anymore

I have explained it and I see nothing in your query that changes any particular. Multiple phases compounds the complexity, it doesn't change first principles. The terminology and usage have been long established and I have described everything by those conventions.

>I cannot think of a simpler way to express
>this although I expect to see many statements (you can't equate 60Hz
>to RF!). Yes you can; a transformer operates as a transformer in the
>same wayat any frequency providing you design it properly for the
>frequency of interest.

RF transmission line transformers DO NOT HAVE TO employ squared turns ratios linked through magnetic flux. The purpose of successful BalUn core designs is to isolate input from output, not to perform magnetic coupling. Hence the topic of choking being so tightly conjoined with RF Z transformation.

Modern BalUns, by this design, exhibit far wider bandwidths of operation than would be exhibited by traditional flux linked transformers. More so, the cores used for modern BalUns would roast in a millisecond under those traditional flux linked conditions where they can easily pass huge amounts of power differentially, and suppress Common Mode currents.

The two design principles are vastly different, but serve the same goal and employ the same terminology: both being called "transformers." One very obvious confounding example to flux linkage is the halfwave coaxial BalUn that is fed in parallel and loaded in series to transform the unbalanced line input from 50 Ohms to the balanced load output of 200 Ohms. No cores or turns ratios were employed to accomplish what the isolation of the line provided naturally. It is confined to a narrow range of frequency, but conceptually replacing the isolation of line length with the application of choking extends its coverage by orders of magnitude.

>This subject is not nearly so complicated as
>some in this group makes it out to be and the topic certainly does not
>rate articles in amateur publications any more than basic application
>of ohm's law does.

Choking, shielding, and isolation - all of a piece - is a very complicated topic and generally dismissed inappropriately. The complexity lies in the breadth of application demands. Analysis proceeds by simple concepts, certainly, but this does not abstract to simple solutions.

I will again repeat the admonition that choking a transmission line does NOT choke each lead individually (which appears to be your sole experience dominated by RFI suppression in 60Hz applications). If this singular statement is cryptic, then you should invest your energy in the study of how the core isolates the input from the output of any "Guanella BalUn." A perfectly good tutorial has already been recommended to you by Roy.

I recently handled an estate sale. Among the SK's posessions was a one-foot piece of RG-8 or RG-213 which he had carefully modified by cutting away about 3/16 inch of the jacket and braid all around the circumference of the cable, near its middle.

I am not sure what use this would be to a ham. Some audio cables are made up with discontinuous shields for elimination of ground loops but I've not seen it done for RF.

Ideas?

I picked up on these and other inconsistencies in the early 1970s. I've
been an atheist ever since.

I wish some few atheists weren't such activists about it, though. It gives
us bad PR and turns atheism into a religion.

Take all of the sheath and the shield off and a piece like that could be used in the making of a gamma match. Partially stripped it could have been for a piece of test equipment or ???

I tried to explain this one failure in my model; it is truely of phase
difference of 120 degree, thus you get only 240/SQRT(3) = 208 RMC when
measuring from phase 1 relative to phase 2. The cure is to imagine a Y
network instead of a delta network; it is much easier to conceptualize
but they are not used so much in the US anymore

Hi Dfinn

Where do you measure voltages on any two terminals to get a 120 degree
phase reading in
a three phase system? How do you divide 240 by the square root of 3 and
get 208?

In 1953, my first ham transmitter had an RF choke to allow
DC to reach the 6146 plate while choking the RF thus forcing
it to follow a different path through the pi-net. RF "chokes"
have been around since before I was born.

From "The IEEE Dictionary": "choke - a device for preventing
energy ... in a given frequency range from taking an undesired
path."

That's exactly what the RF choke in my Globe Scout did in
1953 and that's exactly how a W2DU balun works today.

Assume it is a 1/2WL wire in free space. Where
is the common reference?

I've heard antenna currents called "common-mode"
currents but neither Kraus nor Balanis call those
currents "common-mode". They are usually called
"antenna currents" (in phase, radiating) vs
"transmission line currents" (out of phase, non-
radiating).

In any case, differential currents on a transmission
line are 180 degrees out of phase and ideally, non-
radiating. Common-mode currents on a transmission
line are in phase and radiate. The currents in a
folded dipole are in phase and radiate.

Within a ferrite toroid wired in a 1:1 current-choke-
balun configuration, common-mode current induces flux
in the toroid with virtually none from differential mode.
If the device is made out of turns of coax, the differential
currents never see the choking impedance.

> be radiating fields all along its length transmitting RF all along the
> length of the line.

False! This is easy to visualize and prove. Given a 1/2WL
folded dipole fed with 300 ohm balanced line:

1. Do the out-of-phase differential transmission line
currents radiate? Ideally - NO!, because the fields
from the two wires engage in destructive interference
and cancel.

2. Do the in-phase antenna currents radiate? YES!, just
as they are supposed to do because the fields from the
two wires engage in constructive interference and re-
enforce each other.

Let's look at the balanced output terminals of the current
balun at the source. Instantaneous current is flowing out
of one terminal while instantaneous current is flowing into
the other terminal. I'm sorry, but that is differential,
transmission line current.

It's probably a poor-man's slotted line. A needle is
inserted through the center insulation to access the
voltage on the center conductor.

Not familiar with that soil, but what would happen if you soaked the ground
with water? Would it soften it and/or make a mud that you could sink the
rod into? I do that around nere in the NC clay and it works pretty
well---unless you hit ROCKS. And that is pretty likely, too.

All the above have merit-- One other use- in SOME installations, there
is a requirement to do D.C. isolation - Removal ot part of the sheath,
jumpered by a Capacitor (but if that is what this for, the cap would
be in place). And, as to the first comment, such a loop would have been
used as a direction Finder (the space between the broken shields was
the "sense area of the loop, and, if remember right, you "Null" in the
direction that the "loop" is perpendicular to. - Jim NN7K

Thanks to all. I really think we have it nailed down.

After the first response mentioned a small loop, I did some searching and found diagrams of loops, complete with some recommended tuning capacitors, etc. Today, I dimly recall a metal project box with three coax connectors on it. (Might still have it if it didn't sell.) My first thought was "balun" but a homemade balun doesn't have three coax connectors -- it has just one plus two non-coax connectors. THAT may have been the feed part of the loop. I don't recall if anything else was in that box.

With the gap section and the feed section, then various pairs of coax jumpers would have comprised the remainder of the loop for different experimental sizes. I s'pose I should follow in the SK's footsteps and build myself a loop or two.

Ain't hammin' grand?!?

Actually, the active loop is the outside of the shield, and the gap is the feedpoint. Shielded loops have been discussed at great length on this newsgroup (not because they're complicated, but because they're impossible to understand until a person is willing to let go of some common misconceptions). Anyone interested in these can find the previous postings via a search at groups.google.com.

Sadly, some of the misconceptions are propagated in ARRL publications. It is understandable that people have the wrong idea!

In Switzerland on the 10th of this month they are going to project a particle thru the Earths crust at the speed of light. The particle that they are projecting comes from outer space. So what does this have to do with antennas?
Low energy particles are in abundance on Earth as they are in space but they obtain their own magnetic field as they enter the earths arbitrary field and settle on such things as antennas made from a diamagnetic material!
When a time varing field is applied to a diamagnetic material two magnetic fields are generated, primary and secondary both of which together project the particles off of the radiator with a spinnning action that provides a straight line projection away from gravitational effects. The anti gravity force or the electroweak force is the secondary magnetic field alluded to earlier. This electroweak force is used regularly in scrap metal yards to sort materials by ejection from magnetized conveyor line which produces a magnetic field which ejects metals of a like field into a particular container by the inter action of two magnetic fields as per antenna/radiator. It is the secondary force that is known as the weak force which is a closed field on the material surface called the Foucault current or eddy current which is also used for non destructive metal examination.So soon the CERN project will try to mimic the antenna operation by projecting a particle originaly from outer space thru the crust of the Earth at near the speed of light where they will be captured by a large area of water, which is a diamagnetic material just like our receiving antennas !.

There is none unless you choose to define one. You could go halfway
down the output choke and call it "common refreference" or "isolated
ground" or whatever you want to call it. Since there usually no need
to reference it axcept perhaps for tutorial purposes, I wouldn't call
it anything. You could also reference it to earth ground but only if
you physically connected it to the aforementioned centertap.

> line are in phase and radiate. The currents in a
> folded dipole are in phase and radiate.

The ideal transmission line is common mode and does not radiate
because the fields cancel as you said earlier. The dipole antenna is
ALSO common mode but the fileds do NOT cancel because the conductors
are physically 180 degrees apart from each other so they cannot
interfere with each other; instead the fields radiate into free space
rather than cancel each other out. It is rather simple really. It is
correct to call antenna currents "common mode currents". If the
currents on a transmission line are differential, how would (COULD)
they be converted to common mode currents on the antenna? We would
need a 180 degree phase shift somewhere. Answer: the currents on both
the transmission line and the antenna are common mode.
>
> Within a ferrite toroid wired in a 1:1 current-choke-

Which explains why you should call it a balun and not a choke. If the balun and source impedances match there should be no choking impedance; maximum power trnasfer should occur.

Well actually they are going project 2 locally generated proton beams
around a giant circle at 99.99% the speed of light so that they
collide.

But don't let easily verifiable facts get in your way.

My understanding was that the experiment that I described was the
initiating test where the collider experiment
was going to start around November. So If I am behind in the facts,
and I may be, you are surely aware that one of the tests is as I
described !
Either way the search is for info on the leptons and their bye

products such as Neutrinos which I have stated before can well be the same particle involved with radiatiation. Since you declare your self so up to date I would like to hear your opinion as to why my explanation of radiation is incorrect
instead of immittating a reckless smart arse plus your interpretation of the electro-weak force which overides my explanation?

Wrong, everything goes around in a circle in a vacuum.

There never was a plan to do anything else.

Nothing is going into the Earth's crust.

> Either way the search is for info on the leptons and their bye
> products such as Neutrinos which I have stated before can well be the
> same particle involved with radiatiation.

Wrong, the search is for information on the collision of large hadrons
which are composed of quarks, not leptons, and specifically to see if
the Higgs boson is produced in the collision.

This would be a step in the search for a so called Grand Unified
Theory which would unify electromagnetism, the strong nuclear force,
and the weak nuclear force, leaving out only gravity.

Neutrinos are leptons, not a by product of leptons.

I declare myself able to read and as having stayed awake during physics
classes enough to know there is no such thing as an "electro-weak force".

When one referes to Cosmic rays it really shows that he is uninformed.
Informed people would call it an accumullation of particles that
continually bombard
our earth some of which release their energy when collisions occur
with the earths magnetic field.
Such particles are usually clumps bounded together by the force of

colour that is released in the form of an Aurora
where some speculate it is that that feeds energy to the weather
clouds of Earth that provides time varying magnetic fields
which can create tornadoes as a form of eddy current. Those that
bombard or float thru the earth's boundary are in single particle form
and rest on surfaces that will not absorb them into their overall
atomic pattern. Since the earth is more than 95% diagmatic they can
really settle anywhere.
It is these particles that I am refering to and that is not babble
unless you can prove otherwise. These same particles cannot radiate in
space under their own means but only when under the earth's
gravitational influence and where the anti gravity forces become a
reality.(Newton's law in action)
If you are not aware of the particular experiment that I was referring
to then your posting was intended to cause anger because of the
absence
of anything that could be seen as adding to a conversation in a polite
manner.

Wrong, the term "cosmic rays" is a misnomer as they are actually
individually arriving partcles, about 90% of which are protons,
9% are helium nuclei or alpha particles and about 1% are electrons.

They collide with the molecules of the atmosphere and produce a
cascade of lighter particles.

> Such particles are usually clumps bounded together by the force of

Utter, babbling nonsense.

Cosmic rays arrive individually and are not clumped.

> It is these particles that I am refering to and that is not babble
> unless you can prove otherwise.

More babbling nonsense.

The particles come from space.

Gravity has little influence on them.

There is no such thing as "the anti gravity forces".

The velocities and energies are such that Newtonian physics doesn't
apply and you are forced to use relativistic physics.

> If you are not aware of the particular experiment that I was referring

Oh my!
Leptons are objects of different flavours one of which the neutrino
evolves from.
If I remember correctly there are 4 types of leptons one of which is a
clump of five or more
electrons of which three are of colour form i.e. heavy binding forces
As far as there is no such thing as a electroweak force. The standard
model of physics has four forces of which electro weak
or anti gravity force is one, Einstein spent his whole life looking
for it and it is expected that Higgs field will provide
details. If you want to disagree about the four forces and reduce them
to three then be my guest but it is the weak force

that provides the tilting force on a antenna in equilibrium. I understand that one sea port have tilted all their antennas to get improved performance
which is provided by the "weak" force and its presence is verified by the laws of Maxwell and Newton The experiment I am refering to is the projection of particles from a near earth surface and where the particles travel in a straight line at right angles to the center of the earth where they penetrate the earths surface and emerge some hundred miles away, the particles being called neutrinos which are low life radiation particles that escape from the Sun's
arbitrary boundary. They are one of many types of particles that exist in the Universe some of which are distributed by solar winds.
I would be very interested on what grounds you dismiss the existance of the "weak" force since all the masters of science include that force for the attainment of equilibriumaround which all Universal laws are based around..The weak force does not exist in outer space but when gravity enters the situation Newtons law states for every action there is a reactionI Was Faraday,Newton Coloumn,Gauss, Einstein, Feyman and others all totally in error because of something that YOU have found?
Why not print your physics fact sheet so that CERN can redirect their efforts?

Cosmic rays are particles as you stated Wilkpedia said as much by
saying it is a misnomer,
I also called them particles which is what you contradicted !
Personaly I do not know what the word "ray" defines with respect to
physics since physics
is built around particles that can oscillate. I believe most if not
all of your statements are false
and thus raise the question of validity when you espouse about
antennas of which the "weak" force
is a vital component of radiation directivity and density.
As far as the experiment that I refered to as being non existent the
same as the presence of four forces
with respect to the standard model I would remind you that similar
tests were done in I believe Japan,
where they had difficulty in harvesting the amount of neutrinos that
they had calculated upon but later
proved their calculations were correct. Neutrinos seemes to be the
center of Physics these days with
the may publications yet you seem to know so little about the subject.
I think you have said enough
on this thread to expose yourself
Art

FWIW, there are several projects in the ARRL pubs, mostly for RDF, that
use a short piece of coax exactly as described as a loop.

If transmission line currents were common-mode, they would radiate
like crazy and would be an antenna instead of a transmission line.
When one shorts the two wires together and feeds the system Marconi
style against ground, then the currents are common-mode. (Please
switch your news-reader to fixed font). A '+' indicates a connection,
not polarity.

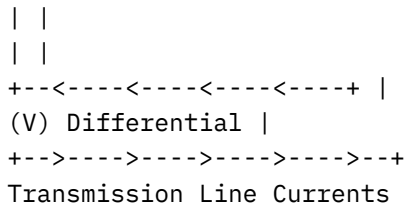
```
+----->------>------>---
| current reference
(V)
| Differential currents to antenna
+-----<------<------<---
Normal Transmission Line mode designed not to radiate
```

```
+-->--+----->----->----->---
| | current reference
(V) |
| | Common-mode currents (becomes antenna)
| +----->----->----->---
GND Marconi Style feed designed to radiate
```

> If the
> currents on a transmission line are differential, how would (COULD)
> they be converted to common mode currents on the antenna? We would
> need a 180 degree phase shift somewhere.

I'm glad you asked. When we take the last 1/4WL of transmission
line and open it up into a dipole, we have rotated one wire by
-90 degrees and the other wire by +90 degrees. That's a 180 degree
difference. The transmission line currents are 180 degrees out of
phase. The extra 180 degrees of physical rotation subtracts from
the 180 degrees in the transmission line for a total of zero
degrees (in phase) at the antenna feedpoint. This is explained
in detail in "Antenna Theory", by Balanis, 2nd edition, page 18.
I will try to duplicate it here using fixed font ASCII graphics.

```
In Phase Antenna Currents
---->---->---->---->----+ +---->---->---->---->----
```



Transmission Line Currents

Note the out of phase currents in the transmission line results
in in-phase currents in the dipole antenna.

Those 5 spokes are a 'capacity hat' loading the bottom half of the 'dipole'.

If the problem is on ONE BAND, I would look at the capacitor assy for that
particular band. They are usually the first item to fail. Your R7 has been
on borrowed time for a few years.

hi

Over the years, I've found it interesting and disturbing even
confusing, that there seems to be so much confusion regarding the
above.

Nothing gets a post responce, like the above topic and boy those
threads quickly grow to large numbers

I always read them trying to learn as well as books on the topics,
i don't pretend to have any formal engineering /scientific
knowledge just enjoy reading what i can

but i ponder why there seems to be so many opposing /contradicting
views on same subjects and topics and i am not referring to just
those here on the news groups

if i get x people in a room ask about baluns or chokes 1/2 say one
thing the other 1/2 say something else

dunno it's strange in all that confusion obviously we all pick
what we interpert and believe to be best but i hate when that happens

From Webster's: "eddy - a current at variance with the
main current in a stream of liquid or gas, esp. one
having a rotary or whirling motion."

Wouldn't tornadoes, spawned around the edge of a
hurricane, meet that definition of "eddy current"?

Baluns are not unique. Religions, politics, investment advice,
brands of vehicles, flavors of ice cream, sexual attraction,
life styles, ... - "We all pick what we interpret and believe
to be the best" in virtually every aspect of our lives.

My personal preference is a 1:1 current-choke-balun with
thousands of ohms of choking impedance, either resistive
and/or reactive.

> what we interpert and believe to be best but i hate when that happens

yeah, i just hate it when that happens... it all stems from many old myths and misconceptions about what baluns do, or don't do... and confusing them with coax cable chokes.

One important note... coax IS a balanced transmission line, its just that the current that balances the one on the center conductor is confined (normally) to the inside of the shield.

i look at it this way:

a 'true' balun is a transformer that converts from balanced to unbalanced lines, it may or may not also transform impedances. this is the type of thing you would put in between a coax and an open wire feeder, or what is included in many tuners that are fed with coax and have balanced outputs. in the degenerate case, which is actually now the most common use, the balanced line is shortened to nothing and the balun is at the feedpoint of the dipole or yagi driven element.

the coax choke is often confused with a balun because it is also used at a balanced antenna feedpoint, but the actual physics of it is much different. if you just connect a dipole to a piece of coax with no choke you really

have a 3 legged 'dipole'. current going out the center conductor wants to return on the INSIDE of the coax shield... however there are 2 paths for this current to take. it can come from the other side of the dipole, the intended path, or it can come from the OUTSIDE of the shield up to the feedpoint then back to the INSIDE of the shield... this is the one that causes trouble. Not only is it usually vertically polarized instead of horizontal like the intended current which distorts the pattern. But it is also not just confined to the coax near the antenna, it can also exist on the outside of the shield all the way back to the shack. Now, a choke on the outside of the shield, either by winding coils of coax or adding ferrite beads creates a high impedance bump between the shield below the choke and the inside of the shield at the feed point. This high impedance reflects any current on the outside of the shield back down, out of phase, thus effectively canceling it out. This means the only route back for the current to the inside of the coax shield is from the intended side of the radiator... thus it forces a balance in the currents, but through a slightly different mechanism than a 'true' balun transformer. Personally i prefer the coil method because all it costs is a bit of coax. The ferrites that are often used can have some unintended effects. first, they are lossy, and some people assume this is their intended mode of operation and use even lossier ones than they should. this results in heating at high power and loss of transmitted power in the choke. also at high power if the cores are not big enough they can saturate which causes harmonics and even more heat plus a loss of effectiveness. The more correct way to look at it is as a single turn choke, the ferrite core should present as high an impedance as possible with as little loss as possible at the frequency its being used at. This reduces losses and the associated bad effects. also note that the coax choke can not transform impedances, the feedpoint must be matched to the coax.

It is similar to a helicopter or a Sedgeway where one must have
stability.
That is why the rotator at the rear of a helicopter follows the
Universal law
of action and reaction mimicing the eddy force.
Same goes for the weather. Lightning is a electrical occillation of
many frequencies
thus follows the same Universal law. When there is a heavy storm that
picks up energy
from the ground and lightning occurrs ir must produce a circulating
force in equal and opposite fashion.
When I spoke of the weather I used it as an example of the swirling
eddy current
where the rest was speculation based on same. Exactly the same
motions occur during
radiation in the manner I spoke of in the beginning of this thread.

It's real easy to get caught up the definitions. A transformer transforms impedance, voltage or current and often isolates but not necessarily. A choke uses the magnetic field created by the AC current through it to oppose that current. The wiki points out there are balanced and unbalanced signals. Webster says balanced and unbalanced lines. Someone posted that coax is in fact a balanced line. OK that can be oddly true, but it can be unbalanced by how you connect it. So it can be part application, part configuration, part common word usage that might not be purely accurate, and where you are focusing your attention.

Still, it can be many prefer to be an expert and argue and make statements rather than ask the questions. I must confess after a project, I often let details slip by me unlike day to day operations that I can't get out of my head 30 years later. I can still align Micor and Motrac radios in my sleep step by step.

The whole discussion could have all been on a roundtable net but then we wouldn't have the luxury of nit-picking and cussing each other out.

For me, a person is allowed to believe whatever they want, as long as it doesn't affect me. Unfortunately, too many of them don't get that part and want to force themselves on everyone.

Oddly enough, the greatest sermon, direct orders from the man himself is ignored by these folk.

Yunno This thread high lights why electrical engineers fail to fully
understand radiation
by viewing it as a electrical phenomina instead of the adherence to
the Universal laws.
True parallel radiators produce radiation when applying just a portion
of the forces in the standard
model such that antennas are formed horizontally to include the
gravitational forces and ignoring the electro weak force
which for equilibrium means the radiator must be tilted. If one

follows the laws of equilibrium which Maxwell's laws do
all forces must be taken into account for three dimensional
resolvement where the yagi involves just a two dimensional
structure, which in itself does not represent ALL the vectors involved
produced by all four forces. The four forces are there ofcourse
because without the "weak force" radiation cannot occur, It is this
force that pushes charges to the outside of a conducter
by the swirling action of the eddy current, which is commonly
reffered to by electrical engineers a "skin depth",.which is also made
use of
in non destructive metal measurements where a fissure breaks the
rotational closed current circuit.
Until scientists stop using computers in the hope that something will
emerge to advance science there will be no progress especially when
they are wedded to that printed in books which is representitive of
present day theory only which times past has shown to be oft times
incorrect.
Correct use of Universal laws such as those of Maxwell are based on
equilibrium where all forces are accounted for and without which
radiation cannot occur. Without acceptance of such we only have self
perceived experts in the hobby of ham radio.

Sevick suggested that the word transformer *NOT* be used
with baluns. He said, in "Building and Using Baluns and
Ununs":

"By far, most misconceptions regarding baluns are due
to the many radio amateurs who perceive these devices
as conventional transformers that transmit the energy
from input to output by flux linkages and not as
transmission line transformers, which transmit energy
by an efficient transmission line mode."

"If the writers had accepted the correct model for
these devices (given to us by Guanella and Ruthroff),
which shows that *THEY ARE REALLY CHOKES* (lumped
elements) and configurations of transmission lines
(distributed elements), ..." emphasis mine.

"In fact, the perception that the transmission line
transformer is actually a conventional transformer
is so prevalent, that a new name for this class of
devices should be considered -
broad band transmission line matching networks.
This name (without the word transformer) would help
in dispelling inaccurate perceptions and in
standardizing the schematic diagrams."

Hi Myles,

Most of this "controversy" extends from the lack of experience. Quite
a natural condition for some amateurs. This will change if they are
interested - interest also being a common condition for amateurs.

Those with a technical bent (rather than simply being interested in
operating) will sit at the bench and figure out this topic of baluns n
chokes n stuff. Then it won't be the controversial mystery it seems
to be for those who don't.

Several reasons..
1) the terminology isn't necessarily consistent in its definition

2) the things get used in a complex system with lots of interactions, so it's hard to separate out the effects of the function of component A from those of components B,C,D, and E.

3) there's a host of empirical evidence out there that seems to contradict the theoretical behavior of A (mostly because the empirical evidence also includes the behaviors of B, C, D, and E, which aren't always controlled for or understood). So you wind up with "A does X" in system 1, and "A does Y" in system 2.

What I "know": is what I can prove that is correct using accepted
known Universal laws such as the laws of Newton and Maxwell as taught
universally.
I will provide all of this when I get the go ahead for my page.
If you can disprove without doubt what I state as a viable theory you
can shatter by providing
evidence where the theory does not hold. This is the way science
progreses and not by stoking the fire
and exercising a loose mouth Maybe it is a mistake coming back and
sharing information on antennas
when all that is required is a target for the uninformed

John, may I suggest that the term :"zero" represents the extreme of
what can be perceived and not a total
nothingness which cannot exist in science. Thus we can have two
phenomina that cannot be identified
in singular form but becomes identifiable when they act in concert.
Best Regards

A few weeks ago, I asked about generating an 140kHz electric field across a leaf, part of a bio-med lab. Thanks for the answers. But it turns out I misread the roster and was in the wrong group.

What I ACTUALLY NEED to do is generate a 100kHz electric field, at 1v/cm, across a T-Bone steak, to measure whether it retards or accelerates decomposition over time. The hypothesis is that the e-field retards growth of certain bacteria inside the meat.

By design, we have not been instructed exactly how to construct the methods and apparatus. I have at my disposal a function generator and various amplifiers.

It is a gross oversimplification to just connect one wire to one end of the steak, and another wire at the other end, and apply 20V RMS across a 20cm steak to generate 1V/cm?

Thanks. Sorry about the idiot questions.

Jim, following your advice I just entered "cern" in Google.
It immediately states as correct everything I have stated in detail
except for the identity
of the "weak" force which I have subsequently discovered.
If CERN provides such an outline of the progress on present day
science and the
path that they are proceding upon then on what premise do you have to
advise
others that all that it states is false?
I recommend that all viewers do the same as I just did and decide
whether
you are correct in the face of what "cern" states !
I see no point in continueing this thread for the benefit of loose
mouths

What you are refering to is the induction process as applied to
present day induction cookers
available in stors for the general consumer

Yes it is a gross oversimplification. What are your controls?

>Thanks. Sorry about the idiot questions.

Hi Jon,

It has been historically proven that the e-fields of 60 Hz current
across the ribs of convicts, over time (about several minutes)
seriously accelerates decomposition. Sterilization would naturally
follow too answering the point about bacteria growth. Between those
two obvious observations, it would seem you have a conflicting agenda.
The hypothesis you are testing seems to want to simultaneously
challenge and support longstanding evidence through shifting frequency
without actually specifying how MUCH current should be applied. Thus
the hypothesis devolves to: "How does frequency enter into what has
already been observed?"

Let me point out that this, too, already has longstanding evidence of
doing pretty much offering the same outcome; and the state, for the
sake of economy, has long since abandoned the hypothesis of performing
executions with 100KHz electric chairs.

To put it simply, you have to many unstated and unfulfilled variables
to call your proposal a hypothesis.

Actually, no, the induction cooker uses a much stronger field. This is a low voltage field (1v/cm) that doesn't cook (or heat) the steak. Supposedly it disrupts internal structures inside bacteria when they try to divide, at least so goes the hypothesis.

Well you are partly correct.If the heating section is not fully
resonant and a time varying current is applied
Then you attain a position where radiation is retarded and replaced by
heat. If the heating section
is resonant then the applied time varying current will only supply the
energy to overcome friction and where all the rest
is radiation. The equivalent electrical circuit is known as a Tank
circuit where applied energy
only replaces the friction involved in the continuos movement of
charges backwards and
forwards between the inductor and the capacitor in a near perpetual
motion..
So in the correct circumstances only a bare minimum of heat is
generated and where
the rest of the energy goes to provide radiation a well known
attribute created for sterelization found by Madame Curie
of France
Cheers

Mr. Clark,

The control is another steak is similar size from the same grocery packaging, placed in a second apparatus that is not powered.

The idea is that a certain frequencies of low-voltage e-fields inhibit cellular mitosis.

The professor saw an article in Science magazine about treating cancer with these fields, and decided it would be a nice lab activity for his students to observe other effects with this type of field.

www.rife.de/files/disruption_of_cancer_cell_replication.pdf

Since generating an e-field in "meat" or "plant material" is not so easy, this is part of the assignment. We need to figure it out and then fully describe it in our methods section. The leaf people are using high-voltage insulated wires. With "meat", which is larger, I don't think this will work. I am wondering if I can use a low-voltage direct connection.

My problem is that our group is weak on electromagnetism. They have been floundering, and now I am floundering with them. I have some ideas, but ideas are best vetted through those with PRACTICAL experience, which you guys seem to have. I have also wasted almost 2 weeks by sitting in the wrong group. OK I am an idiot in terms of BOTH electromagnetism and reading directions.

Bottom line: I need to generate a 1V/cm field across a t-bone steak. Merit or no merit (this is college). Does anyone have any place I might look on line, or any book I might buy, or any advice on how I might accomplish this?

Thank you.

the problem is, do you want the field 'inside' the meat, or in the air around the meat? The problem is made harder because the steak is not only a dielectric material, which changes the magnitude of the field, but is also moderately conductive, which essentially shorts out the field. also, the properties depend on the direction of the field... you might want to see if your library has this article: http://ieeexplore.ieee.org/xpl/freeabs_all.jsp?arnumber=300250 . personally

i would probably go the other way and suspend the meat on an insulating net horizontally and put a plate above and below it that are bigger than the steak. it is much easier to generate a uniform field between large parallel conductive plates than with wires... as a first approximation make the plates about double the largest dimension of the steak. it may be acceptible to set the steak on one of the plates (sterilize it first) and just suspend the other one above it.

Hi Jon,

Let's examine the hypothesis of "low-voltage e-fields" in light of the
source:
In Vitro Experimental Set Up. Cultures were grown in standard
culture dishes (4-well cell culture chambers; SN 138121; Nalge
Nunc International). The TTFields were generated by pairs of
15-mm-long, completely insulated wires (P/N K-30ï¿½1000; VT
Corporation; outer diameter, 0.5 mm; ethylene tetrafluoroethylene
insulation thickness, 0.125 mm; dielectric breakdown,
1800 V/mil) fixed to the bottom of each dish at a distance of 1 mm
from each other. The wires were connected to an oscillator
(GFG8219A; Instek) and a high-voltage amplifier (A303; A. A. Lab
Systems Ltd.) that generated the required sine-wave signals
(range, 300-800 V).

This would equate to an average of 5,500V/cM or roughly 275kV across
the chest of a convict. History reveals that this prisoner would be
specially prepared with conductive paste and electrodes that were NOT
insulated (such as specified in your source). Thus we have two
differences:
1. Frequency (100KHz vs. 60 Hz);
2. Insulation;
3. Application (in situ vs. in vitro).

>Since generating an e-field in "meat" or "plant material" is not so
>easy, this is part of the assignment. We need to figure it out and then

>high-voltage insulated wires. With "meat", which is larger, I don't

>think this will work. I am wondering if I can use a low-voltage direct
>connection.

You would then be changing the conditions from testing fields to
testing conduction. Ask yourself, if faced with the prospects of
sitting in the electric chair, would you care to amend the conditions
to include insulative pads at all points that formerly contacted the
seat? Your rational answer would suggest you already know you are
redefining expectations.

>accomplish this?

You stick to the source if you want a good grade. To replicate the
experiment, you have to conform exactly to the conditions, but not
necessarily the means.

It follows from shallow reading (speaking of my own efforts, not
yours) that there is not much current flowing (otherwise this would
immediately place us in the chair with the convict). This is to your
advantage. You use the function generator you have, apply it to what
is called a step-up transformer to obtain the voltage specified; and
you come very close to the original conditions. Your function
generator should have enough power to both step-up and supply the low
current (you will have to confirm this through other means). You will
have to use a small portion of meat because this is an e-field
experiment that is measured in volt/meter. Choosing a T-Bone
exacerbates your voltage problem, and making a direct connection
invalidates it.

Almost any insulated wire will perform adequately, the source is
simply providing information for you to choose a suitable alternative,
it is not necessary to find the exact reel of wire from a specific
manufacturer. Google for the topic "100 KHz voltage transformer" and
you will find a design that shows you how to construct one within an
hour of obtaining the cheap components. It is merely a matter of
ratios (how much voltage out of your function generator, and how much
do you need?). This, of course, requires you to have a voltmeter that
measures voltage at that frequency.

Go to the EE department and visit their second year circuits lab.

Thank you! In hindsight, obviously applying a field top to bottom will
be easier than side-to-side!

I need to research it, but I should be able to calculate the voltage
required to generate the 1v/cm field in the steak if I know the
dielectric constant of the "meat"...

One question, what if the plates both touch the steak and I use a
smaller voltage? I guess since steak is conductive, keeping the plates
at a 1V/cm potential may actually sink a lot of current through the
steak and cook it after all.

Hi Jon, through Dave,

Let's examine what is offered above, and the fault in a large T-Bone.

The original work was performed with an average of 550V across a gap of 1mm which contained a sample of cells. Those cells, too, shorted out the voltage, but across a shorter distance.

Most function generators will only source several volts at best, let's call it 5.5V to simplify comparisons. We replicate the field arrangement with a 10cM portion of steak. When we revisit the field strength, we will find it has plunged from the normalized 550,000V/m of the original work to the now feeble 55V/m or 4 orders of magnitude lower field of your suggested work.

It would follow from the original author's thesis that your efforts will show 4 orders of magnitude less results. Call it zero. There's no point in doing it without replicating the fields as specified in the original.

Jon, the idea of heat is confusing you!. The BBC aired a segment from
Germany
where they placed a slab of ice on top of a induction oven and then
placed a cooking utensel
on top of the ice so they could cook its contents. If the induction
oven was creating heat instead of a radiation field
one could surmise that the ice would melt . This was not the case as
radiation bypassed the ice and gyrated towards
the diagmagnetic cooking utensil. The experiment may well still be
shown on U tube!
I have just to get away and do some honey dooos !

Hi Jon,

The dielectric constant of anything is a sidebar, or distraction,
simply because you don't know the dc of the original work's cells
either. In all probability they are the same, but this is unnecessary
information.

More to the matter is where you derive 1V/cm from the original work's
application of an average of 550V (nearly 3 orders greater) to 1mm gap
(exactly 1 order smaller). Your 1V is off by nearly 4 orders of
magnitude.

Again, if you were a convict and they let you set the voltage DOWN by
4 orders of magnitude, you might ask for a cool drink while the threw
the switch and waited several hours for your execution. They may have
to suspend it on account of darkness until the next dawn.

Mr. Clark,

In the introduction, they describe, "In the present study we show for
the first time, to our knowledge, that very low-intensity (2 V/cm),
intermediate-frequency (100ï¿½300kHz), alternating electric fields induced
by insulated electrodes have specific inhibitory effects on dividing
cells in culture."

The novocure dude is talking about 2 V/cm, and the prof here is talking
about 1V/cm. I don't need to duplicate this experiment, I need to
immerse a T-Bone into a 1V/cm, 100kHz e-field. I appreciate your help
so much, but I don't understand where 550,000V/m is coming from???

In fact, they do report the dielectric constant, and as I speculated,
nearly identical to that of steak (or seawater for that matter).

>More to the matter is where you derive 1V/cm from the original work's
>application of an average of 550V (nearly 3 orders greater) to 1mm gap
>(exactly 1 order smaller). Your 1V is off by nearly 4 orders of

In fact, they do report 1V/cm.
The electric field intensity was mapped within the cell, based on
the amplitude (1 V/cm), frequency (100 kHz) and waveform (sine) of
the electric field applied to the cell culture.

Unfortunately their reference for this was
11. Volakis JL, Chatterjee A, Kempel LC. Finite element method
electromagnetics: antennas, microwave circuits, and scattering
applications.
which cannot be applied to a situation where the wavelength of
excitation is 3000 meters and the gap is one thousandth meter. The
calculation of 1V/cm based upon the application of an average of 550V
across a 1mm gap flies in the face of credulity.

However, and again confounding their use of power amplifier to deliver
1 V/cm in the near field, there is the report:
The electric field intensity in the culture medium was measured by
means of a probe, consisting of two (0.25 mm in diameter)

insulated wires with exposed tips 0.5 mm apart, that was dipped in the culture medium. The wires were connected to a high-input impedance differential amplifier that translated the waveform amplitude into a calibrated steady voltage that was digitally recorded. Field intensities throughout the manuscript are expressed in peak voltage amplitude per centimeter (V/cm).

Care was taken to eliminate any pickup from the field outside the culture medium. Continuous field monitoring could also be made by measuring the potential drop across a 100 Ohm resistor placed in series with one of the field generating wires.

This last statement lacks data about what voltage was observed and says nothing of the contribution of field's interaction with the leads going to it to measure the voltage across them.

I can understand your desire to simply shove your function generator's output directly into a steak. It is a choice that is tantilizingly teased as an option given this report of 1 V/cm. It also raises the curious aversion of the authors from performing the same test and removing the absurd complexity of amplifiers and remote senors. Afterall, 1 V/cm is trivial to obtain, demands no external amplification, and whose level can be monitored from the function generator itself.

All of this (in concert with missing data and no computation shown) suggests a problematic correlation of results (which are inarguable) to field strength.

Again, science would say replicate the conditions and observe if the results follow. You can make your own correlations. All things being practical, the application of an average of 550V across a 1mm gap demands a better reporting of a finding of 1 V/cm in the sample.

Hi Jon,

Take 550V (the average of their amplifier's 300-800V capacity) and
place it across 1mm. How many volts per meter?

Consider the claim and specification of 1V/cm. How many volts per
meter?

How many volts will you need to obtain 1V/cm across a T-Bone steak
measuring 20 centimeters?

If you can solve one, you can solve them all.

Where did the missing voltage go? This is a simple series impedance
relationship that is linear with distance. To obtain 1V/cm from the
author's source demands that there is considerable impedance isolating
the sample from the excitation probes. This could be accomplished if
there were a huge air gap between the first excitation probe and the
cells' culture, and perhaps a corresponding huge air gap on the other
side of the cell culture towards the second excitation probe. The
ratio of impedances would be 550,000/10. The sum of both air gaps'
impedance would have to exceed the cell culture's impedance by this
ratio.

This is possible, but the report is obscure to that possibility. The
introduction of field measurement probes would be exceedingly
disturbing to the balance of impedances too. The diameters of those
probes consume half the gap within which the cell culture resides, and
lay in exceedingly close proximity to the excitation probes! The
probes themselves present more mass and area than the cell culture.

The claims are specific, but all the evidence points to the authors
having convinced themselves of a very problematic measurement. They
are, afterall, no more versed in the art of antenna math and finite
element modeling than you are. They got numbers to be sure, and
performed what every student would recognize as "plug-n-chug."

However, you are more interested in the results than the claims. Your
assignment, as I understand it, is to investigate what results follow
from your own variation of their work. Unless you are trying to also

validate the correlations to fields, which I seriously doubt you could do, and would be suspect through direct attachment (as it does not conform to the original); then I would suggest you think smaller gap (not a T-Bone), up the voltage (as offered), and measure bacterial activity.

Or, in your own terms:
>What I ACTUALLY NEED to do is generate a 100kHz electric field, at
>1v/cm, across a T-Bone steak, to measure whether it retards or
>accelerates decomposition over time. The hypothesis is that the e-field
>retards growth of certain bacteria inside the meat.
Set your function generator for a 1 volt output, separate two probes by 1 centimeter, place 0.99 centimeters of steak between. I will hope your grade isn't scored in competition to others puting their effort into more voltage across smaller gaps.

If I am a genius it is only by comparison to the likes of you.
Put in "cern"in google where the first item that comes up is Cern's
stated purposes where they specifically state there are four forces in
the standard model
So your idea that the "weak" force is fictitious as well as a swarm of
particles should be referred to as cosmic "rays" whatever "rays" are
totally incorrect as well as your other statements. Other readers can
review the article
and judge for themselves your level of knoweledge in physics and
radiation.
Remember, when you exercise your freedom of free speech you supply the
means
for others to judge exactly what and who you really are. You would
have been better off
giving the reasons why the weak force is fictitious thus showing a
measure of your logic abilities
rather than allowing your lack of knoweledge forcing you to rely
emotionaly on the impact of insults!

From CERN itself:
CERNï¿½s mission
Research, technology, collaboration, education
found on CERN's own web page "About us" where nowhere appears any
references to any number of forces, nor any discussion of standard
models.

>a swarm of particles should be referred to as cosmic "rays" whatever "rays" are
>totally incorrect

Searching CERN's own website for Cosmic Rays reveals 12 documents
within the first one of which clearly states:
Cosmic rays are charged particles that bombard the Earth's
atmosphere from outer space.

The second of those 12 articles, in the FIRST SENTENCE states:
The giant CMS particle detector at CERN has been sealed and
switched on to collect data for an important series of tests using
cosmic ray particles.

The third of those 12 articles, in the FIRST SENTENCE states:
Cosmic particles are raining down on CERN.

The fourth of those 12 articles, in the FIRST SENTENCE 2nd paragraph
states:
Cosmic rays are charged particles that bombard the Earth's
atmosphere from outer space.

and on and on.

>Other readers can

Sure, you can have the plates touch the meat. If it's 1cm thick, put a volt across it, and you're done.

As you point out, though, if you put that field on the meat itself (whether by direct contact, or because it's suspended between two plates with air in the middle), current will flow, and heat will be dissipated. Your exercise is to figure out how much, and how hot it gets.

Assume the thermal capacity is the same as water.
I'd assume the conductivity is about the same as sea water (60 mS/cm) as a start.

Really? Interesting concept ... hydrogen just is, has always been,
always will be ... such as a belief in God?

So, no one made any of these elements, they "just happened?" Where is
your proof, what law is behind your logic. Doesn't the scientific
method demand proof in repeatable experiments? The experiment you imply
in your reference, I am ignorant of that one. I know you must be busy
revolving in that logical world you seem to be engrossed in--but, just
for my sake, you could you provide a reference to it so I can examine it
for myself?

If a personal attack fails to bring the victim to his knees:

1) Attempt an attack in the mans use of grammer.

2) Attempt an attack in the form of his writings.

3) Attempt an attack on the choice of the words (hell, just like
scrabble, longer/complex words should count for more! <grin>)

4) Attempt an attack on sentence structure, abbreviation, "slang", etc.

5) etc., etc. ...

Something will finally gain some idiots attention ...

1839. Re: E-Field across MEAT

Newsgroup: rec.radio.amateur.antenna
Date: 2008-09-06 00:56:41 UTC
From: "J. Mc Laughlin" <jcm@power-net.net>
Message-ID: <QvmdnR9N_dTVSFzVnZ2dnUVZ_qTinZ2d@bright.net>
Source record: 22713

Dear Student Mc Leod:

Roy Lewallen has a useful suggestion. I evaluate the performance of inanimate objects in a TEM cell, which may be thought of as an expanded transmission line. Zapping (an old EE term) an object with 100 v/m is not difficult, however that is not likely to be significant in your case.

Your DUT (device under test) is a piece of meat. Room temperature meat has a significant conductivity. Even at 100 kHz, the conductivity of the meat results in the field amplitude decreasing rapidly below the surface of a thick piece of meat. Thus, if you were to use a TEM cell to place the DUT into a 100 v/m field, the DUT needs to be thin or you can not say that the whole DUT was subjected to 100 v/m. While all of this is going on, the DUT is exposed to air-born contaminates that may well be different than those of the control.

If I had made this assignment, it would be because I expected the good student to perform an analysis of the experiment and prove that it was most unlikely to be a valid experiment. Alternatively, a student who I would recommend for graduate school would present me with a paper that shows what improbable measures would need to be taken (and why) to have a chance of having a valid experiment. The poor student is one who does what he or she is told to do without critical analysis.

I have lived long enough to have several of my past students as honored colleagues. They all are able to think.

Make friends with people in the EE department or some practical physicists.

Do report back on what you ended up doing.

Regards, Mac N8TT

OK. Since you seem to be "dirt stupid" and have been given some ignorant, preconceived notions which you DO NOT have a mind capable of lodging valid arguments to ... I will explain it to you, but just once:

You seem to think hydrogen is a "God"--is, always has been, always will be ...

However, while you would discredit a GOD, you would have us believe these elements which are, always have been and always will be, can, on their own, "evolve" into complex beings (biological machines) such as ourselves ...

However, in that same breath you will discredit that exactly such may have occurred so long ago, in such a distant past we cannot even fathom, and did result in a being so advanced, complex and so ahead of us that we have no choice other than consider him/her/it/the-alien a God ...

Gees, your mind would have interested me--when I had engaged kindergarten! <ROFLOL>

Hi Jon

Is it practical for you to place the T-Bone between two plates?
I would try a pair of parallel plates with the T-bone between them, fed
with a 100 KHz, generator and the voltage across the plates adjusted to
produce the field strength you want.

Midi-chlorians (also spelled "midi-clorians" or "midichlorians") are
a
microorganism in the fictional Star Wars galaxy, first mentioned in
Star Wars Episode I: The Phantom Menace. They are microscopic
life-forms that reside within the cells of all living things and
communicate with the Force. Midi-chlorians compose a collective
consciousness and intelligence, forming links between everything
living and the Force. They are symbionts with all other living
things;
that is, without them, life could not exist. The Jedi have learned
how to listen to and coordinate the midi-chlorians. In order to be a
Jedi or a Sith, one must have a high concentration of midi-chlorians
in one's cells.

The word "midi-chlorian" appears to be a portmanteau of
"mitochondrion" and "chloroplast", two organelles found in real cells
and thought to have evolved from bacteria as endosymbionts inside
other cells, as purported in the endosymbiotic theory. Creator George
Lucas has indeed stated that the midi-chlorians are based on the
endosymbiotic theory (Rolling Stone, June 2005), and it appears that
in the story of Anakin Skywalker, he wanted to create a more modern
"virgin birth" in the Star Wars saga that was as much based in
"science" (albeit fictional) as in philosophy and religion, with the
mythic
"givers of life" being microscopic life-forms, rather than gods.

An ancient prophecy foretold the appearance of a chosen one imbued
with a high concentration of midi-chlorians, strong with the Force,
and
destined to alter it forever. Anakin Skywalker was thought to be the
one.
He had the highest concentration of midi-chlorians the Jedi Council
had
ever seen. He was possibly conceived by the midi-chlorians; Anakin
was born without the assistance of a male. Lucas has said in
interviews
that Luke Skywalker had the same total midi-chlorian count that
Anakin

did at birth, though this does not necessarily make him the Chosen one
because Anakin did exactly what the prophecy foretold by coming back from the Dark Side and destroying Emperor Palpatine.

In Star Wars Episode III: Revenge of the Sith, Palpatine states that a
Sith Lord, Darth Plagueis, had the ability to use the Dark Side to influence midi-chlorians to create life and to prevent people from dying.

The Force can enhance natural physical and mental natural abilities, including enhancing strength (such as during a 'Force jump' or to slow a fall from an otherwise dangerous height) and accuracy as when Luke Skywalker was able to launch proton torpedoes into a small thermal exhaust port on the Death Star.
A number of other force powers are demonstrated, those include but are not limited to telekinesis, telepathy, enhanced empathy and precognition.
The Jedi were also able to influence and control the minds of others by making use of the Jedi mind trick. The Sith can sometimes use the Force to create harmful energy to attack others. Darth Sidious, 'the Emperor' is able to conjure a lightning-like attack using the force.

Within the Star Wars expanded universe, a number of other powers have been demonstrated, those include the ability to heal or drain the life-force of others, increase resistance to attack, dissipate energy attacks and warp space.

"edit" ? What on earth are you talking about?
I am still waiting for an answer why you believe the "weak" force is fictitious.
What proof do you have? I gave an explanation of it in a series of examples
that are in use today which explained radiation. It shows the procedure which
can also be accompanied by mathematical proof using the laws of the masters
and the antennas can be made quite easily if one wants to use a test range
which usually come under fire from naysayers. Is there only three forces
in a standard model or can you quote the presence of more?
Your postings supply zero content to support your beliefs. All we are getting from you
is expressions of emotion and anger that is shielding your brain from activity.
I think it is better that I leave again for a while so the newsgroup can sink back to inactivity
but I will come back.....I think!
Have a very happy day with the belief that you were correct in every way in this dual on physics
since nobody but I found fault with you. Ofcourse the "weak" force is fictitious the experts on the group
provided nothing to show you are in error so you are in the company of like thinkers.
Put your 2 by 4 away I am running away scared to death
Regards
Art

> 73, Cecil http://www.w5dxp.com

Upon doing independent research, it turns out my theory is exactly the same as your's but my terminology was reversed. The situation is summed up in an article by W8ji:

(quote)...the line will not radiate or contain substantial electric or magnetic fields external to the line area. The lack of external fields, even at a very small distances, is rooted in two conditions:

1.) All outgoing currents on one conductor are matched by equal level and exactly opposite phase currents on a return conductor at any given point along the line. (The reason I said the line will not radiate) This causes an exactly equal and opposite magnetic field along each conductor. The opposing magnetic fields caused by equal currents flowing opposite directions cancel magnetic fields outside the general area of the two conductors.

2.) All voltages from each conductor of the line to the outside environment surrounding the line are either contained within a closed shield, or are exactly equal and opposite an imaginary neutral reference point representing the environment around the line (balanced lines) (I discussed this imaginary reference point in some detail as well). We always have a constant ****differential*** voltage across the line (between the conductors) and that voltage changes only with standing wave ratio as we move along the line.

3.) The vector product of differential current flowing in conductors and voltage between line conductors at any point along the line always equals the power transmitted in transmission line mode. (unquote)

So I simply reversed the terminology and I agree that your use of the term "differential" was correct. I was calling the mirror image current pattern "common mode" when it should be differential.

But I still shy away from matching impedances with a "choke". I would match impedances with a balun or RF transformer. I agree that you must isolate, either mechancially or electrically, the input from

output on a balun. I made the simple mistake of confusing the terms differential and common mode. Thank you for the correction. And I have tried using the CM mode marconi style feed (shorting the antenna at the transceiver input terminals) to try to get my 80m G5RV to radiate at 2Mhz some years ago, as suggested by MFJ in their instruction manual, to no avail. I am sure it can radiate quite well at some frequency however!

When directly quoting something written by someone else, it's good form
as well as common courtesy to give credit to the source.

The first clue here was the use of "portmanteau", not a word I would
expect to be in an original posting in this newsgroup except perhaps
from Richard Clark.

I've seen some in books and on the 'net. Years ago, I did a one-week job on a Coast Guard cutter and I got to see some HF loop antennas that are standard issue for cutters. I do not recall with certainty whether they were transmit or receive or both, but I think they were both, but not at the same time, as certain USN fanwire antennas are.

HRO in San Diego usually has at least one HF loop on display.

Jon-

Are the bacteria you want to retard inside the meat, or are they on the surface of the meat? You can't reach those inside due to the meat's conductivity, except by using enough energy to cook the meat.

If on the outside surface, then the problem is much simpler. Use parallel plates but insulate the meat. Since meat is conductive (compared to air), do not include its thickness in your calculation of volts per meter. In other words, subtract the meat thickness from the spacing of the plates.

Yes, the bacteria should be conductive. Their finite resistance will interact with the capacitive current that flows in the circuit, retarding their growth (or not!).

I suggest you try it with a third (or fourth) steak, at different field intensities. Perhaps 0.1 v/cm, 1 v/cm, 10 v/cm, 100 v/cm or whatever you can manage with the available equipment.

Fred

We can repeatedly and consistently experience the effects of
hydrogen - it does not take an act of faith or a delusion. We
cannot carry out the similar experiments with any of the so-called
deities - we can only believe.

But, like I said if it gets people through the night that's fine and
it may well be better than taking drugs.

As I have pointed out ... a "leap of faith" is a leap of faith ... whether being made in an attempt to "look intellectual" (evolution) or being "intuited of spirit" (God) ... and, an argument for evolution is only a circular "back door" argument for the possible existence of God ... it is simple logic.

What is perplexing is how some can carry on these arguments without realization on what final point the argument(s) really argue! This is supposed to look "intellectual?"

God just toyed with Moses, like a cat with a mouse, and that
"negotiation" wasn't for real. Moses didn't know it, but God
already knew the outcome so any other outcome was impossible.

To feed my sick sense of humor, and boredom. When in college brushing up, I would scan and print $20 bills, just one side, wrinkle them up a bit, and drop/plant then about. Observing from a distance, I kind of felt like God--I knew what the "outcome" would be every time some unsuspecting victim found one! <grin>

>

Hi Jon

At your frequencies, a slab of meat will mostly resemble a resistor with some capacitive reactance. The resistance will vary with the thickness and area of the slab you're applying the signal to.

Memory fades, but I recall that you will be looking at resisitivities on the order of a few hundred ohm-cm. (R = rho * L / A).

At a field strength of 1 V/cm, the power levels will be pretty low -- the meat won't cook noticeably. The currents should be manageable, that is, I believe that your signal generator will be able to hold the 1V/cm without additional amplification.

This will be true as long as the load resistance is >> the 50ohm output impedance of the signal generator. There is a decent chance that your meat slab will be less than the desired impedance. In this case you will need to measure the voltage periodically and adjust the generator output: As the meat degrades, its conductivity should be increased by the spillage of conductive cell contents.

You will want to apply the field directly to conductive plates which are in contact with the meat -- if you have any air gap between a plate and the meat,
the voltage drop will essentially be all across the air gap, none across the test sample.

The lumped element equivalent of the transmission line itself is a
repetitive pattern of inductors and capacitors. If all inductors are
chokes, then the transmission line itself is composed of chokes.

In a "linear-lumped-sum", such as a transmission line containing
capacitance AND inductance in a liner fashion (i.e., per in, per ft, etc.)

In a single lumped sums, it would be in as much error to display them as
such, as the error(s) in your terminology ...

I've been thinking about this. There is a question on how to get an e-field into the meat, and there is a question about whether bacteria exist in the meat.

I am assuming there is bacteria in the meat, but I've searched all kind of FDA and safety sites, and I don't see anything discussed except ground meat, so I don't know. Maybe there is not, just bacteria on the surface.

As to whether you can get an efield into the meat, I found that the authors of the paper actually made a "helmet" to kill brain tumors in living patients:

http://tinyurl.com/5aatcs

They use insulated electrodes (dozens of them, apparently), but you do have to shave your head so they are close to the scalp. Are they really driving 1V/cm into someones brain without cooking it? Or is the actual field required to kill bacteria (and cancer) actually much smaller than 1V/cm? If the voltage is low, why don't they just put the electrodes in contact with the skalp?

I have not idea if the trial is working, but if the device is curing patients, then whatever this box does would kill the bacteria in the meat (whether its there or not) without cooking the meat. I'm assuming they have fancy DSP to control all of the electrodes, but they still have to obey the laws of physics.... I think the field intensity to do this job may be WAAAAAY less than 1V/cm.

Hi Jon,

I think that has been examined to death (no pun). The field does not
cease to exist, it simply has plunged from 550,000V/M to 10V/M (if the
suspect methods' data exhibit any correlation to reality).

>and there is a question about whether bacteria
>exist in the meat.

If it does (and there is no presumption that it "cannot"), then it
would be called an infection or necrosis.

>I am assuming there is bacteria in the meat, but I've searched all kind

Take a hint from your source that had 10 microliters of cell solution
spread out over the dish. Not much volume, not much thickness to call
"inside" either.

>As to whether you can get an efield into the meat, I found that the

This is truly Bizarre.

>They use insulated electrodes (dozens of them, apparently), but you do
>have to shave your head so they are close to the scalp.

A very telling question, and one they should have asked, and answered
for themselves. This link points to some very inferior quality
experimentation.

In the 1960s, a product for cooking hotdogs (10cm) was sold. It
consisted of exposed metal prongs that penetrated to each end of the
hot dog, and were, in turn, plugged into the wall. Net result: in 3
minutes you had a broiled hot dog from 12V/cm.

I have already drawn one preliminary conclusion from this whole
exercise: I have purchased a wired (old-school, not bluetooth) earpiece
for my cellphone.. e-field or no, it sure wont hurt anything to do it.

Consider the meat as a resistive material, as I've already proposed.
If you apply a voltage across the meat, that voltage will distribute
itself
across the thickness of the slab. (but with interesting distortions
around the
marbling, which has a significantly higher resistivity).
The distributed capacitance will make some second order effects but the
basic
applied voltage across a medium / voltage field in the medium effect
will remain.

If there are no bacteria inside the meat, what is the purpose of aging?

>
> Are they really driving 1V/cm into someones brain without cooking it?

What's the power density of 1V/cm into a 1cm cube of meat (or brain)with
300 ohm-cm resitivity?
How does that compare to the power density reheating a quarter pounder
in a 600W microwave oven?

Quarter Pounder, Mmmmmmm.

i think its normally assumed that bacteria contaminate the surface of cut meat during handling and from exposure to the air. ground meat is more likely to contain bacteria because it is ground... that is, the outer, possibly contaminated, surface is cut and chopped and put in contact with lots more meat surface, so bacteria can get spread throughout the mixture... and of course there is always the contamination probability on the grinding equipment which is much more complicated than a simple knife or saw used for sliced meats.

This is an example of the 'traditional' 9:1 impedance transformer which,
on most MW and SW frequencies, gives a better match between the antenna
impedance and a 50 or 75 ohm receiver input impedance. On relatively
narrow bands of frequencies where the antenna impedance is naturally
lowish (where it is near odd multiples of a quarterwave), the match will
actually be made worse than if the transformer were not used. This
obviously depends on the physical length of the antenna. In the diagram,
the antenna length shown is 33m (say 100'), which is not far short of a
quarterwave on 160m. However, on the MW band, and on various parts of
the SW band, the transformer should improve reception.

I note that the writer correctly stresses that that the transformer is
an 'UNUN' (an accurate - but ugly - word). Many similar articles about -
and adverts for - these devices WILL insist on calling them baluns
(which, of course, they are certainly not).

The direction of either winding on the torroid should not matter one
bit.

along the lines of another poster i would propose an alternate experiment
that could be much more closely controlled. instead of starting with
unknown contamination in meat, which is in itself a non-homogonous
substance, it would be easier to setup and control a standard Petri dish
contaminated with known bacteria samples. Those should be easily provided
by any decent biology lab, and can be properly analyzed and scored using
standard methods for measuring bacterial growth. Those methods are well
documented, and again, any decent biology lab should be able to assist in
the analysis.

Ive seen sensors for SWR made his way. Slide a wire under the shield
from each end and termiate them in the middle with a resistor.

Hello ML,

Is it really opposing /contradicting or just different?

Most baluns (in antenna systems) are used to make sure that the
current in the antenna structure is far higher then the common mode
current in the feedline.
Common mode current = Icenter + Iscreen.

To say in other words: function of balun is to make sure that the feed
line does not take part in the radiation process.

Some issues that may affect the type and actual design of the balun:

1. "far higher" (how good it mist be) is not a hard figure and depends
on the application. Requirements for a field day will be different
then for an EMC measuring antenna in an anechoic chamber.

2. The behavior of the balun depends on the impedance levels (both
common mode and differential mode) on both balanced and unbalanced
side. A balun for a full wave dipole "receives" more voltage stress
than a dipole for a HW dipole (at same power level).

3. A balun can be narrow band and wide band (ferrite core baluns [wide] versus resonating transmission line [narrow]).

4. Some baluns have the function to generate two opposite voltages with respect to another point (even when the load is not fully balanced [for example in electronic circuits]).

5. Financial issues may play a role (especially in mass volume products). A balun on PCB is far cheaper than a coaxial one with ferrite cores.

6. How much insertion / mismatch loss is allowed, what about power handling?

Just by mentioning 6 points, you can imagine that a certain balun does perform well in application A, but not in application B. A wrong type of balun for a certain application may even make the situation worse (while that balun is OK for another application).

Like Cecil, when 1:1 impedance is OK up to VHF, I prefer the current choke balun (the one with the ferrite cores). If possible with low Q factor for the common mode inductance.

For the upper UHF and SHF, performance of ferrite ceases and other types (like shorted quarter wave sections or tapered lines) can be used.

As there are many varieties, two poeple may say different things, but they are both right.

1892. Quick Rooftop Antenna For Channel 2?

Newsgroup: rec.radio.amateur.antenna
Date: 2008-09-07 14:25:59 UTC
From: JoeSch <joeschultz1@lycos.com>
Message-ID: <3dc06661-0a64-4e5d-9449-6543cb2d9aba@l42g2000hsc.googlegroups.com>
Source record: 22616

I apologize for making this about TV reception instead of radio, but I did not know where to turn.

I live in Connecticut, about 100 miles from New York City, (102 miles by the lattitude-longitude charts) and I am about a block from the water, Long Island Sound.

I grew up in New York and am a NY Jets and Giants fan, which is broadcast from the Empire State building. The Giants' games are carried by one network, but the other Connecticut stations only carry Patriots games, not the Jets.

The Jets' games are carried on channel 2 New York, which is 102 miles as the crow flies from my house. Football packages on satellite TV are beyond present financial condition. I only care about channel 2, New York.

Does anyone have any ideas for a quick rooftop antenna I can put on a pole and run into my house for the Jets game? I really don't mind if the signal is somewhat snowy as long as I can make out what is happening on the field-beats radio. Besides, this is football-sometimes it snows for real and nobody complains, lol.

Anyway, any help would be greatly appreciated.

PS: I have seen websites for dipole antennas. My second question is: If I make a dipole antenna, what if I mounted it on a piece of cardboard or styrofoam for it's length, which cardboard or styrofoam has aluminum foil on the reverse side? The aluminum foil would not contact the dipole, and be separated from it by one quarter to one inch, depending on material thickness. The reason I ask is if this will cut off 180 degrees of reception, thereby improving the signal to noise ratio, (I know a little about electronics as an audio hobbyist, but very little about antennas even though I have tried to get a grasp).

> the SW band, the transformer should improve reception.
>

Actually, the antenna terminals for the HF bands is marked "500 Ohm" on my S350DL, 9 X 500 = 4,500 Ohms (the transformation I would expect from a 9:1.) However, the author did claim an improvement of a number of S-Units on his S350DL. This made me wonder, since I didn't want to build it to see what was up, I just passed it along. I would not call the author a "liar" without absolute confirmation ... who knows, perhaps his "antenna arrangement" has resulted, somehow, in the end of that (actually off center feed point) being 4,500 Ohms--perhaps Grundig lied and the antenna terminals do exhibit a 50 Ohm impedance--I am lazy ... some youngster can figure it out ... ;-)

> I note that the writer correctly stresses that that the transformer is
> an 'UNUN' (an accurate - but ugly - word).

Actually, I would not refer to it as an UNUN. A balun is a TLT device, in following, and since UNUN was coined from balun, I would expect UNUN to only apply to TLT devices. The device in the article is a simple RF Transformer ... I like UN-UN, and the logic of following the naming convention of the Bal-Un is followed, making it "intuitive."

>> Many similar articles about -
> and adverts for - these devices WILL insist on calling them baluns
> (which, of course, they are certainly not).
>
> The direction of either winding on the torroid should not matter one bit.

The device here is not, IMHO, an UNUN, it is an RF Transformer, my first post referred to it as such ... The winding direction, in regards to the relationship of the direction of one winding to the other, matters a great deal--indeed, since a 180 degree phase relationship is at stake, the direction causes one to be an "opposite" of the other ... I have always found the phase reversal winding direction(s) to exhibit superior

behaviors ...

I thought all VHF television transmission will be discontinued as of
February 2009. Building a VHF antenna would seem to be a
wasted effort. You need to think how you can receive the
same station on UHF digital. There are plenty of UHF antennas
available; you may also need a low noise, mast-head, pre-amplifier
to get a good signal.

Regards,

Frank

Hi Wim,

I presume "screen" is the coax shield. If there is any Common Mode
current, it is going to reside on the outside of the shield in a
different degree than inside the shield where it will be combined with
Differential Mode current.

In fact it would be simpler to measure it there too.

>To say in other words: function of balun is to make sure that the feed
>line does not take part in the radiation process.

Only if the BalUn is designed with choking properties, otherwise it
will make no difference at all in feed line radiation. To quickly
summarize from popular labels, you have Current BalUns and Voltage
Baluns. Such labels differentiate those that choke and those that do
not, but they are often misapplied and represent no real guarantee.
The informed buyer should always examine the construction details.

>Some issues that may affect the type and actual design of the balun:
>
>1. "far higher" (how good it mist be) is not a hard figure and depends
>on the application. Requirements for a field day will be different
>then for an EMC measuring antenna in an anechoic chamber.

This is an unusual issue. There is no correlation to need and
frequency. There is no correlation to application and frequency.
Motivation may even dictate you ignore chokes and BalUns altogether
during field day for simplicity's sake. If you demand performance,
then all the rules of choking and BalUn application apply at all
frequencies.

>2. The behavior of the balun depends on the impedance levels (both
>common mode and differential mode) on both balanced and unbalanced
>side. A balun for a full wave dipole "receives" more voltage stress
>than a dipole for a HW dipole (at same power level).

The point of a BalUn is to transform from the source Z to the load Z.
If the load Z happens to be high, you select a BalUn with its ratio

designed appropriately. Hence the variety of ratios as no single design is appropriate at all frequencies for a single antenna. Voltage (or current) stress is part of the design criteria, not a limitation to its application.

>5. Financial issues may play a role (especially in mass volume
>products). A balun on PCB is far cheaper than a coaxial one with
>ferrite cores.

This point, and two before it (not quoted here) seem to speak to small signal, board level applications. They have no application with antennas. For instance, no one is going to find any application for a BalUn on a PCB (for which I see no distinction) unless the antenna is also on the PCB.

>6. How much insertion / mismatch loss is allowed, what about power
>handling?

BalUns that are appropriately selected to the load have a far greater chance of performing without issue than many other matching solutions. Consider the insertion loss of a typical, external tuner compared to that of a BalUn that satisfies the same mismatch. I suspect you will probably lose far more power in the tuner, or at best achieve parity with the BalUn. This is not to say that a BalUn solves all problems and is the universal solution, however.

>I prefer the current
>choke balun (the one with the ferrite cores). If possible with low Q
>factor for the common mode inductance.

In fact, the 1:1 Choke BalUn has very little inductance to offer, and some formulations of ferrite may even present a minor capacitive reactance. The major characteristic of ferrite is Resistance, and it is the resistance that offers the isolation (choking) from input to output.

Quick would be a rabbit ears set on the roof. Space your reflector at some
distance so that your antenna and reflector look more like an H. What you
really want though is a Rhombic antenna. Google that. It is a diamond
shaped wire antenna with some real gain.

Hi Joe,

The long answer is No.

The short answer is that with the transmission antenna at 1250 feet
(give or take), it sees out to an horizon 25 miles away. An antenna
on the ground there would receive its signal, but you would have to
lift it as you pushed back. By the time you pushed back another 25
miles, that receiving antenna would also have to be 1250 feet in the
air. That is only 50 miles range for a very unlikely audience. You
are challenge by an additional 50 miles, which, from your perspective,
places the top of the Empire State building beneath the earth's
surface by a considerable depth. No amount of amplification will
rescue that situation.

Hi Joe,

If you are a betting man, this frequency has a reputation for world
wide reception.... if.

It is an exotic topic, and you might astound yourself with seeing the
game, but don't invite the crew over expecting to happen. The odds
are strictly for Vegas as this exotic topic is called tropospheric
scattering, or ducting, or meteor shower DX, or any other number of
long-shot methods.

Easiest and probably the cheapest is to buy a radio shack deep fringe antenna. A chimeny or Eve mount should be the easiest, it not feasible a 20 foot piece of 1" steel pipe would do nicely. I got denver stations in cheyenne in the 50-60s with a winegard antenna on a 20 foot pole. Transmitters were on lookout mountain or so I was told..... Channel Master and Wingard are two other great tv antenna manufacuters.

Tom
A diamagnetic material (over 90% of the elements on earth are
diamagnetic)
does not absorb a free or non bonded electron into the subatomic
structure of the element!
So the many types of particles that enter the earth's atmosphere can
safely settle or be at rest.
Many particles arrive every second, some with spin which means they
have a straight line velocity
while others arrive with little or no spin and thus wander thru out
the stratosphere and some will get propelled
by solar winds. These particles number in the multi millions per cu
metre on earth but are so small and with little energy
that they are difficult to detect in science. One of these particles
consist of small energy which escapes from the Sun
similar to smoke where the" energy less" particles are carried away
without particular direction. But on entering the earth's boundary
they do become magnetized on a very small scale from the presence of
the earths magnetic field as they float down to rest
on the multiple diamagnetic materials on earth, which also includes
water on the ground and airborne droplets This is why the term
diamagnetic is so important in the science of particles and radiation
bearing in mind that minute particles from the Sun have a very short
nuclear life which is why the Sun expelled them in the first place!
So Tom, the reference of diamagnetic is not a form of " leg pulling "
or a maniacle uttering but an important part of radiation and antenna
phenomina.
Very best regards
Art Unwin KB9MZ.....xg

You should note that one of the particles I referred to is the
neutrino
which is oft times referred to an off spring of the big "W" which must
certainly occur
while contained within the arbitrary boundary of the Sun or solely in
the mind of Feynman.
The word neutrino will supply energy to the upcomming naysayers as
always who will
confirm that all is known about the Universe and the antenna radiation
phenomina

For cable with solid screen, Iscreen = I_inner + I_outer.
To go in more detail (I thought) was not relevant for the original
question.
For radiation, and distance between currents <<< WL, only common mode
current counts (and you can measure that with a current probe).

> The informed buyer should always examine the construction details.

A fully balanced load can be connected to an unbalanced feed line with
a voltage balun (for example center tapped transformer), a choking
type balun is not necessary for this. So I do not agree on your

point.

> frequencies.

Did I mention frequency under point 1? I ment to say that requirements
for the balun (how good it must be) depends on your application. For a
field day you may ignore the balun function at all (you may burn your
fingers), but for an Antenna Range, you need a good one with high
common mode attenuation (when you use a balanced reference antenna).

Impedance transformation is a "byproduct", main function is to couple
balanced circuit to unbalanced circuit without feed line radiation.
The stress applied to the balun depends on the impedance level. I
mentioned this to show that even with dipoles (and same power) you can
have different designs (or size). Yes, a choke type balun that can
handle max. 1kW into a HW dipole, will probably run hot (or flashes
over) when used on a thin FW dipole with same input power.

> also on the PCB.

I designed some PCB baluns for feeding PCB antennas and wire antennas
connected to the (tiny) PCB, because of ease of production (no other
handwork required). They perform not as good as a coaxial type, but
good enough for the application.

> is the resistance that offers the isolation (choking) from input to
> output.

This depends on the type of ferrite, frequency and final geometry of
the balun. Although not preferred (possible change on parasitic
resonance with capacitive common mode impedance), an inductive common
mode choking action can provide good isolation (as long as reactance
is high enough with respect to the impedance at the balanced side).
For JOTA I use a choke type balun that is inductive (with low Q
factor) for 80m, while it is almost resistive for 40m.
>
> 73's

That article was a real snoozer. As most of them are, they associate an increase of entropy (2nd law) with an increase of randomness as time moves "forward". Thus, a beautiful (orderly) greek temple built in ancient times becomes a random disorderly pile of dust and rubble millenia later. Certainly such randomness happens but the error is that we must complete the observation until maximum condition is observed. As if by some revelation, "scientists" (according to the author) have found increases in time symmetry with increase in entropy with RNA. What they have really discovered is that they do not bound their observations into a closed system which would require observation until maximum condition occurs. Of course, in many cases that is not possible but certainly they should recognize that their observations are incomplete. One example of an observation that gets closer to a closed system in time would be Darwin, found in the evolution of life. As cells divide, randomness (entropy) assigns a certain probability that mutations will occur. Such mutations are examples of assymetric time moving irreeversibly towards randomness. However, when your expand the observation to include the entire system of time and environment, you find that certain benign mutations are much more suited to the environment and the life form becomes improved. We have evolved from single cell life forms to human life, which follows a path from a much lower level of orderliness to a much higher level of order. Entropy (disorder) is actually what gets us there. I suspect it is the concept of "entropy" and not "time" that needs to be better understood.

John

You hit the nail right on the head about the S350DL having a 500 ohm input but no 50 ohm input. I had the exact same questions that you brought up so I E-mailed the author to clarify some of the questions. I have a feeling that he is not using a S350 but an actual comm receiver with a 50 ohm input.

Still waiting for a reply..

I have not experience winding baluns so I will ask one more question, making it as general as possible, So here goes.

How do I wind/build a "Current Balun" (I state a current balun because all I am try to do is reduce RFI noise and change from a balanced antenna to an unbalance input) That has a ratio of 1:1, and preserves the impedance on either side of it. I would preferr not to use bead but a Torrid instead

example :

450 ohm antenna input impedance (balanced)---- balun-----450 ohm external antenna jack on my radio.

Now, on another note, my problem might be that I do not fully understand that the input impedance of a T2FD antenna changes depending on what frequencies I am trying to receive. Would this be a correct statement?

If so, I will most likely need an atenna Tuner correct??

Once again, I appreciate everyones help. This continues to be a great learing experience.

Actually I have been posting here as dfinn, KR4AJ and AI4QJ, and on "policy", since 1995 on nando.net. There have been several John Smiths' and John Does' over the years who have posted anonymously and the Cecil Moores' Gary Caufmans' and Todd Littles' that did not. You can say that you were an original John Smith but I never believe anything that anonymous posters write. Certainly you can even accuse them of being senile and not feel bad because it is as if you are writing any other inanimate object that does not have a brain.

Oh, Bubblesdee, do not think "I know something." I have watched far stranger "hook-ups" than what we debate, work!

If you have the core, if you have the wire, you can attempt multiple configurations, hook them up to your receiver, and "KNOW FOR CERTAIN!" Wind 'em one way, then the other. If you do as "he" did, on a PCB, they a tough with a soldering iron, a few turns in the opposite direction--you have learned something new (self-education!)--the world it yours, quit asking these "dummies" and KNOW!

I am "caustic" to some of the "know it alls'" here, just because they are stupid and I have done the homework to know it ...

I honestly would expect the author in question noted an improvement, recorded it in his text--and let it stand. I would not be so surprised if you duplicated his instructions and met with an improvement(s) in the direction you are headed--indeed, this is the major reason I "passed them along to you."

Too often, you only find "idiots" here ... :-)

Good luck, "wind 'em a few ways", experiment, you have data close enough to achieve you ends easily, with only a few tweaks!

Warmest regards
JS

> It is like a nightmare where the public servants are the people which
> the police are supposed to protect us from!

John,
When in conversation with Hately of cross field claims he told me of
the difficulty
of getting the chance to explain his inventive antenna to the IEEE
international meeting.
He told me that he got the brush off with the statement that antennas
has been studied to death
and all is known about antennas. When I tried to share my ideas on
antennas to the antenna laboratory
of the University of ILLINOIS I pretty much received the same brush
off so I believe professor Hately
comments. When I share my hobby with people on this newsgroup I pretty
much get the same reception
tho in the case of this newsgroup you cannot have a conversation on
the physics of antennas as
many never made it thru a physics class!. Just a few days ago it was
suggested that the weak force was just fantasy
and the idea of particles involved in radiation was laughable. Some
time ago this group was universal
in denying the mathematical quality of extending a Gaussian to that of
Maxwell so the resposes that you get

can be measured against those in terms of quality.Some months ago I spoke about the fact that antennas such as a verticle must be tipped to achieve maximum gain. No curiousity just laughter and rude comments and one stated we don't need a new design antenna as we all ready have one.This inspite of the fact that Naval antennas in one sea port have universly tipped all their antennas for quality reception! Does the U.S. navy do silly things like tipping antennas without attaining irefutable facts? So with the above comments you cannot expect any questions reflecting curiousity about science and antennas as just like those of lower interlect or education who cannot find the words that are needed resort to swear words and insults to display a measure of testerone in the absence of brain power. The days have gone when radio hams became members of the group in search of the new science of radio propagation as now all is needed isan instruction on how to turn on the radio so talking heads can rattle without curiousity of the means to do it. But don't dispare, there are hams around of the old school it just happens that they do not dwell on this newsgroup as most want intelligent return with respect to conversation. If there was respect on this newsgroup we could all learn and advance but there are many that are limited in that respect and resort to actions that display testerone instead similar to the gang make up in our cities where the communities are not now self sustaining leaving rubble for self perceived desired turf.
Best regards
Art

WCBS, CH2 NY, will be on UHF channel 33 (digital) after 2/17/09. So, don't
waste your money on a ch 2 antenna.

And don't forget that a new gamma match must be calculated. See
http://www.ve3sqb.com/ and search "gamma" on the page for his antenna
design program "Gamma".

Yeah, most of have explored those "ballpark" equations/formulas for
gamma matches. I even translated one from the basic language to C.

In the end, it is "cut and match."

First of all, don't introduce any other metallic objects (foil, etc). Just
the elements described below.

You need to make a basic yagi antenna. When finished, it greatly resembles
a TV antenna, except the elements are all nearly the same size, optimized
for Channel 2. (Neglecting the fact that WCBS digital TV is on a UHF

channel. You asked for analog WCBS-TV, Channel 2.)

Fabricate a folded dipole for 57 MHz out of regular TV twinlead.
Here: http://www.wfu.edu/~matthews/misc/dipole.html
Looks like he uses Channel 2 as an example -- convenient! He says it's 2.5 meters long -- I think that's about 98.4 inches

Probably should mount it on an 8-foot piece of 1 X 2 wood to keep it straight and level. An inch or so will stick out at the ends -- no big deal. It will go on the roof, mounted crossways on another piece of wood called a "boom" which is aligned to New York City. The folded dipole's position on the boom should be about 2 feet from the end that will be away from New York.

That is the active or "driven" element of the yagi and it needs some helpers. The helpers are made of ordinary metal tubes, but have no direct electrical connection to the driven element. Old aluminum tubing is fine. Assorted pieces of old TV antennas will work if the pieces are tightly fastened together and carefully cleaned at the attaching points for a good connection.

One helper is called a "reflector" Make it 6 percent longer than the driven element and mount it on the boom behind the driven element (away from New York) by about 21 inches.

Next helper is called "Director #1." It's 1% shorter than the driven element and it's mounted on the boom 21 inches in front of the driven element, toward New York.

Next helper is called "Director #2." It's 8% shorter than the driven element and it's mounted 37 inches in front of Director #1.

You can add more directors, same length, same spacing as #2, but they won't capture a lot more signal after the first few. Plus, with more than two directors, the boom gets really, really long.

Note that this antenna is a 300-ohm antenna. Since your TV input is probab ly NOT 300 ohms, you have to transform the impedance to the 75-ohm coaxial cable that plugs into the TV. Do that near your antenna. What I mean is this: Have only about a foot or so of 300 ohm twinlead coming down from the folded dipole. Connect a 300/75 ohm transformer or "balun" at that point and run coaxial cable the rest of the way to the TV. Much better for interference rejection, especially at Channel 2. Such 300/75 ohm baluns are available at all radio stores as well as many variety, drug and department stores. Buy whatever one you think you can connect with the tools at hand. You may have a balun or two that came with an old TV or VCR.

The first one of these I ever helped build was made with coathangers on a broomstick for Channel 13. (Higher freq meant smaller elements -- easier.) It worked fine.

Let us know how this works for you. I'm interested to know if you were able to follow what I wrote.

Both can be taken apart, resize the element length and reassemble them with 10 meter element spacing. Maybe you could retain the 20 and 40 meter antennas for future use and make a new 10 meter from scratch. There are lots of plans on www.dxzone.com. Lots of luck

In the version that I heard it was the null that the 'suck out' caused that
led to an investigation that resulted in the prosecution.

Now whether this is true or not is another matter.

I seem to be under the prosecutors gaze!
The prevailing theme of this group is to deny change!
They deny the tipping of antennas
They deny the extension of Gauss's law mathematics
They deny the existance of four forces in the standard model
They deny the role of particle science with respect to radiation.
They deny the requirement of equilibrium in all Universal laws
All of this is not bad in itself as long as they provide evidence to
the contrary
but none is provided only contempt of the new. If one did not think
all was known
there would be natural curiousity by those who have searched for truth
via education.
For those who have not endeavered to search for the truth excercise
the freedom of free speech
so that others are able to determine who and what they are so they may
be avoided.

It seems to me that a resonant structure to capture energy would
re-radiate so I can't see where such a null would come from, the
wavelength is long so the path difference between the main tx and the
re-radiator would make such a phase shift difficult to achieve.

Surely that would only be true if the power was not dumped into a load? The power in the load has to come from somewhere, and if it is in the load it is not in the aether.

If you want more difficulty, stack the two toroids
together and wind ten turns of RG-400 on them. :-)

It depends on the power captured vs the power in the load, but in any
case the aperture of the loop is fairly small and cannot allow energy to
be captured from outside that aperture. In comparison with the size of
the transmitting antenna and the field it generates this must be
insignificant I think.

In fact, I wonder if he could really run a house full of fluorescent
lights this way.

I thought the farmers equipment caused four "nulls", or local minima, in the
radiation pattern.

Well put! I notice that the rules have been changed so that veggies
will be irradiated to kill the e.coli and salmonella bacteria on them.

But as you say, the food will still be spiced with whatever excrement is
present.

This will of course have the end effect of making the food filthier, as
teh new Attitude will be "The radiation will get the germs, so I don't
have to clean it.

I guess we'll have to change the name to "Jalepeno Poopers".

Can a 20 or 40 meter antenna be used to transmit on different bands?
Yes. It depends on how you mean that, though. Either can be 'cut
down' for use on higher frequencies, or 'trapped' and used on lower
ones (so some ridiculous point). If you mean used as a directional
antenna as they work on their design bands, then no, they won't work
that way without that physical modification. There may be some
'directionality' to it, but not like they are supposed to be (that
make sense?). It can work, but not 'well'.

Actually, e-field could be a much better way to kill bacteria on the surface of vegetables, if this whole kooky idea works. I mean, holy crap, if they're using it to cure brain tumors, it can probably sterilize the food without genetically damaging it.

I do recall a story about 30 years ago (possibly apocryphal) about a farmer
who lived on the UK side of the Radio Luxemburg transmitter and powered his
cattle shed from the radio waves, and was prosecuted. Radio Luxemburg had

some sort of phased array and the cows electrical use disrupted the beam.

Nothing wrong in your line of questioning but your pattern is usually
of stirring
so it depends on what you do with your answers. As to how I think I
will give you an example
Reference was made to "Cosmic particles:" which is a term given to
the" bombardment" of particulates.
So to me that makes me think of what names are applied to particles
that "bombard" which by itself suggests
the possession of spin and velocity, characteristics that are
different from those of neutrinos.
If you know the answer and where they come from I too will be
gratefull if you give me an answer!
Another thought extension of Gaussian law of statics equates to
Maxwells laws thus if one equates both of these to zero
statics particles in space without the influence of gravity and the
responding" weak force" cannot possibly, on their own, radiate
in space UNLESS external components are applied that magnetize the
static particles. Food for thought I would say.
and a measure of how I think. I believe that J.S. thinks in a similar
fashion.

Hi All,

All of this remains highly suppositional and suspicious both. One
need only graze beneath a common 110KV transmission line to experience
field levels of 1KV/ft (33V/cm) to find no lower bacterial risk (and
frequent claims to the contrary of these fields having healative
powers).

As for this last parenthetical, it demonstrates you can pick any topic
and populate it with vapid ideas that embrace conflicting claims for
the same weak evidence.

Centuries past there was a cold spell on Earth where it is stated
radiation propagation did not occur because of the lack of sun spot
observations. This period lasted about 30 years if my memory is
correct.
Now we appear to be in a state of global warming presumably because of
the actions of the Suns vibrancy which would suggest the present
increase in sunspot activity of the past century will continue to
increase and the next Sun spot cycle will be a good one. So don't give
up on antenna experiments just yet as the particulates will be a
coming

While the field under the tower, in the absence of any conductors, is as you say (actually, the earth has a field on the order of 1kV/m just from thunderstorm return currents). If there's a conductor in that field, though, that does not imply that the field within the conductor is the same.

Didn't Tesla propose using DC current, basically broadcast/produced from thousands of transmitters. In order to use the electrical current/field, all one had to do was ground one side/wire to Earth. The other side or wire would be the receptor/antenna for lack of a better term.

I'm not a technical person but I think I have the basic premise right.

No. It wasn't DC, since DC is direct current. That was Edison who
would have needed a power plant every half mile or so. Tesla was hyping
"Broadcast power" which was lossy broadband RF power that would wipe out
most of the usable RF spectrum. Due to the 'Inverse Square Law', it was
impractical, and always will be.

Tesla was responsible for AC power distribution, which pissed Edison
off.

FWIW, the Wikipedia article:
http://en.wikipedia.org/wiki/Wireless_energy_transfer
describes some of Tesla's ideas and also has a list of references to more
recent wireless energy distribution schemes.

Jim
Since you are with the space agency I jumped threads to ask a
question.
When a space ship leaves earth or a satellite is stable in the sky I
assume that all
are in thier own magnetic field because of relative motion of earth.
Is it possible that there are a connecting magnetic
field in the Universe of a like polarity tp that of a geo satellite?
I would assume spacecraft record magnetic changes on their journey
but I have read no details of such measurements. When I use computer
programs to determine
a radiation field in free space of an antenna in equilibrium the
resulting radiation is zero as predicted by the extension of Gaussian
law!
Which begs the question, what provides the two like magnetic fields in
a geosatellite or are charges just sliding off the end
of antennas not in equilibrium? (no gravity or combative weak fields
being present)
Regards
Art

Only in the near field (at the site). Theoretically, there is a limit to the number of receivers for any one signal (swamping), but that number has never been approached.

As for the original story, I can verify that it CAN be done, and is done inadvertantly in places where homes are found in the area of an 'antenna farm'. In Portland, for instance, the antenna farm for the high powered FM signals is in a residential shared area. Some homes within that area that use fluorescent lighting still have some light from the tubes with the switch turned off. This is not full light, but neither are they using a tuned circuit.

A spacecraft, like any other body, is immersed in whatever magnetic field there is around it, plus whatever field it has itself (imagine launching a bar magnet into space). In the case of an earth orbiter, the field of the earth is strong enough that electromagnets in the spacecraft can be used to change the orientation. Some spacecraft record the magnetic field as part of experiments to measure the solar system's magnetic field distribution. For these measurements, the spacecraft's own field is subtracted out. It's either measured or inferred from a series of measurements (e.g. if you spin the satellite, and measure the field, the varying component is due to the surroundings

and the fixed component is due to the spacecraft... well, it's actually
more complex, because any soft magnetic material on the s/c affects it
too. The process is like swinging and calibrating a ship's compass,
see, e.g., Chapter 6 of Bowditch:
http://www.irbs.com/bowditch/pdf/chapt06.pdf
)

No rumor about it. Westinghouse published several papers on electricity where he described voltage and current phase and had a true understanding of it. Edison was a hands-on experimenter who had little theoretical physics or mathematics background. That's why the two had a feud about AC vs DC. After Edison's assistant died of radiation poisoning, he was very leary of things he didn't understand and tried to convince people that AC current was just too dangerous. He also refused any more experiments concerning radiation.

well art, this sounds like a challenging situation for your theory to
predict what happens... if there is no gravity to cause the magical mystery
particles to settle on the diamagnetic elements and therefore they keep
sliding off, how do satellites communicate with each other? a zero
radiation by your extended guassian law sure doesn't help either! maybe you
need to do some more thinking about all this stuff.... or you could do some
actual research and see what the magnetic field environment is at
geosynchronous altitude... just as a hint, take a look at this GOES Hp plot
here: http://www.swpc.noaa.gov/today.html then to get a look even farther
out you can see the magnetic field that is part of the solar wind that moves
your magical particles here:
http://www.swpc.noaa.gov/ace/MAG_SWEPAM_24h.html maybe the particle
densities they measure can actually be related to your magical mystery
particles?

Tesla worked for Edison when he came up with AC power distribution.
Edison favored DC for some reason and Tesla quit and went to work for
Westinghouse. When the electric chair was proposed Edison did everything
he could to discredit it because it used Tesla's AC power.

> particles?

David, yes it was a challenge to my theory which led me down many paths of thought.
You may remember that I expoused that charges travel thru the center of a conductor that is not in equilibrium.
From the laws around equilibrium a charge on the outside of a radiator has no sideways motion thus per Newtons laws
of action and reaction.Thus if the charge does move sideways then a charge also moves on the inside of the radiator
again by Newtons laws. This suggests that in the case of a non equilibrium radiator the circuit at the end of the radiator has two choices.
! to creat an arc to complete the circuit
2 to travel down the center of the conductor where the resistance to flow is solely wire resistance.
Quito Equador showed that in a thin atmosphere using a radiator not in equilibrium arcs would flowat the ends of the radiator.
This phenomina was cured by using a closed circuit antenna such as the Quad where the same choices did not occur.(it is in equilibrium)
So in my reasoning in outer space which is a vacuum an antenna cannot radiate without external components.
When using a antenna program with an optimizer when inserting an arrangement in equilibrium first you get more gain on Earth
than one of the present state of the art where "weak force is not included in the algerithums and
2 when placing a array in free space the resulting radiation is ZERO.
Exactly what one would expect of a Gaussian field of statics when there is no fracture of the arbitrary boundary. So David that is how I resolved that question before I spoke of current flowing thru the center
of a radiator. By the way there is no evudence that particles eminating from the Sun arrive by Solar winds where particles receive a charge
by relative movement to Earth (Einstein?) Remember, Einstein only established the Laws of Relativity because of his disapointment of not determining the Weak force which he needed for the Grand Theory of a Universal Science/laws otherwise know as GUT. Using my aproach to radiation I consider Einsteins
thoughts to be proven correct, tho not accepted as I am not an academic involved in a scientific structure, otherwise known as not invented here syndrom.
I will look at the URL's supplied by you to see what they have to offer.
Now I can say
Best regards
Art Unwin KB9MZ.....xg

Try it at any scale, and that certainly is true. Roll back this tape
to the beginning and offer the same observation.

There you would find upwards to 800V laid across 1mm of separation.
Within that 1mm are two .25mm probes measuring a field described to be
1V/cm. Those same probes fall prey to your observation. Then carry
that forward to a medical (sic) device doing the same (sic) thing with
far less potential to the same (apparent) field, for a vastly greater
bulk of conductive tissue.

Yes, "fields" have been trotted out as the universal panacea - in the
face of a counter argument for those same "fields" neither of which
have any real science between them.

Very good. So here are two separate magnetic fields external to the
boundary enclosed
static particles which migrate to a diagmatic surface (the antenna)
and since radiation does occur
we can assume a collision of these magnetic fields which is opposed by
the synthetic gravity
of the space craft that generates the weak force. That leaves one
gigantic problem of apparent weightless ness
as seen on TV unless it is still there but not readily evident given a
particular time segment.
Thank you very much for supplying the above comment and I will now
look at the URL presented

Ah! My mistake. You have no sexual interest at all. It was merely a
weak -feeble- reference mixed into your confusion of CERN's mission.

Are you suggesting that CERN is an extension of a sonnet, or do you
simply spit on Shakespeare to see who you can get wet in the crowd?

I do believe it was in the early 1800s because the River Thames froze
in London such that they were able to
have a fair on the ice.Remember the river is tidal ! I seem to
remember that there were no sunspots observed for some thirty years!
Not a good time for radio if it happens again. I will research for the
actual facts and get back to the forum

"The first electric chair was made by Harold P. Brown. Brown was an employee of Thomas Edison, hired for the purpose of researching electrocution and for the development of the electric chair. Since Brown worked for Edison, and Edison promoted Brown's work, the development of the electric chair is often erroneously credited to Edison himself. Brown's design was based on use of Nikola Tesla's alternating current (AC), which was marketed by George Westinghouse and was then just emerging as the rival to Edison's less transport-efficient direct current (DC), which was further along in commercial development. The decision to use AC was partly driven by Edison's claims that AC was more lethal than DC."

David what you presented is way beyond my pay scale and requires a detailed knoweledge of the particular procedures and measurements Same goes for the URL of the compass presented by NAVY? But with reference to your term "magical mystery"
which I take as a knock on my knoweledge of physics. David you cannot deny that the intersection of two magnetic fields provides a extra force that is not in line. A short study on levitation should resolve that one. The other one is the sorting methods used in savaging materials. There are many pictures and references to the use of levitation and non invasive metal measurements all of which are a following of Newtons laws as well as the well founded reference to eddy currents as the return force which creates stabalization. As I stated before this same law of Newton can be visualed by reviewing the mode of rotation of the two rotors on a helicopter to achieve stabalization or equilibrium in movement Knowing the above which I am sure you do, the use of "magical mystery" can be seen as a some what mocking statement, and for why? And where does particle density fit in as opposed the energy content
of something that is so small. If indications such as Weber or Gauss were measured maybe it would make sense thus I am totally lost. With respect to compasses I never realized that it consistedf of so many components to protect against so many actions as well as the induced magnetism created during manufacture . the disasters in the golden triangle as well as with Amy in the pacific it would seem that all should carry a sextant as a backup!

It was recently reported that zero sunspots were recorded in August of this year. However, there must be some charged material up there since I consistently hear CQ's from Europe in the morning hours and Western states (and sometime Europe in the afternoons) on 20m. The Maritime Mobile net is alive and well. I know there's nothing on 10m, which I believe should be more more utilized in the FM mode with repeaters to promote local utilization. Otherwise the unlicensed 18 wheeler transportation industry will take it over for us.

I read it in either the Smithsonian or the Scientific American
and as I remember the article involved Black Holes which at the time i
likened to
the Newton reaction to the Big Bang which I apothesized the Black Hole
duplicating
the swirl of an eddy current to create balance in the Universe. Yes, I
know I am mad, or insane
but without imagination and "what if's" I would wither away. Soooooo
you will have to go to the library
and look at back copies say for four months and then you will find it.
When I say early 1800 I remember seeing
the old sailing barges on oil paintings of the same era which traveled
up river from the tidal basin where my grandfather was a customs
inspector
I was born in the docklands less than a mile from the Tower of London
so the rivers history stays with you as well as the destroyed
residence near St Georges!.
I remember waiting for the tide to go down and then pick up pieces of
thrown away clay pipes of Elisabethan
times in the hope that I would get a match. Very Very difficult to do
but I guess they only used the pipe once and then threw it away
thus many pieces. The docks were all bombed and set afire with
magnesium so it was natural to demolish them when shipping boxes
came into fashion and they moved the docks to a sea port on the East
coast. Union tickets were prized for workers as they were handed down
in the family
One Uncle was a stevedore but I turned the ticket down to become an
engineer with peanut salary!

Hmmm...I thought the induction cooking process was merely a "cool-top"
cooking appliance using a large inductor to generate an AC magnetic
field. The h field does nothing at all to the food but it induces
currents in the (ferrous) cookware which heats the cookware allowing
it to be used in a manner similar to "hot" top resistive cooking
elements. In this case the resistance is in the cookware itself,
dissipating power from the induced current. That's what I thought it
was anyways...

If you want to really prevent bacteria growth in food, may I suggest a
good dose of Cobalt 60.

I remember that: It was called the "Hot Dogger". It worked quite well.
Oscar Mayer hot dogs and the like are assisted in the hot dog zap-
cooking process by the large amount of electrolyes (salt content) used
in processing the "meat". It was a resistive heat cooking process of
course, nothing exotic, but 12V/cm it was.

Sunspot are not the only indication of Neutron release just an
indication somewhat under a solar flare where
release includes particles of more than half life such as wreckage/
debris and fumes. The rotation of the poles
ensure fracture of the arbitrary boundary for emmisions of particles
but if the Suns core cools due to the pole shifting
then there is less expansion within the boundary providing less
straying from equilibrium.
Now with the earth heating up scientists say that the sun is
expanding and in a zillion years will
swallow the earth no less, A extra large flare or eruption literally
is a releaso of nuclear energy
which goes to power lines as an impulse similar to the electrical
outage created in
Hawaii when they exploded a hydrogen bomb at low elevation.Which is
why yhe Navy suddenly reverted back to tube technology with radios.
In each of these cases it is the debris composed of more than half
live
nuclear products which does not compare to the miniscule energy of a
unbound electron called a neutrino. However when neutrinos
congregate in bunches they have a large energy input creates by color
binding which when split apart creats an aurora for thousands of miles
which amount s to a lot of energy release within our arbitrary border
which some say provides energy to the upper atmosphere and

provide worldly circulation of weather clouds, storms e.t.c.
Certainly a lot of speculation with regard to the arrival of
particulates the majority of which have not been identified.

OK. Not quite about antennas, but before 1960 such very non-UL devices existed. Since my dorm room had a 120/208 system, and students in those days actually knew what that was, with a different phase on one side of the room than on the other side of the room, one could zap a dog in a short period of time with a cross connection. .... and I still have all of my digits and such. Learning took place in multiple places - in those days. Of course, one needed to survive....

I remember that: It was called the "Hot Dogger". It worked quite well. Oscar Mayer hot dogs and the like are assisted in the hot dog zap-cooking process by the large amount of electrolyes (salt content) used in processing the "meat". It was a resistive heat cooking process of course, nothing exotic, but 12V/cm it was.

I believe you are correct since special cookware is required with
induction cooking
and I would imagine it also has a large magnet inside the inductance
as opposed to air

Explain why Edison Electrocuted an Elephant with AC. He wanted people
to think AC was too dangerous to use.

It was recently reported that zero sunspots were recorded in August of
this year. However, there must be some charged material up there since
I consistently hear CQ's from Europe in the morning hours and Western
states (and sometime Europe in the afternoons) on 20m. The Maritime
Mobile net is alive and well. I know there's nothing on 10m, which I
believe should be more more utilized in the FM mode with repeaters to
promote local utilization. Otherwise the unlicensed 18 wheeler
transportation industry will take it over for us.

--

I have only been on HF for a year and a half, so my history with propagation
is limited. However, I understand that the sunspots augment/boost the
charged material which will always be there at a minimum baseline value. A
common measurement is the 10.7 cm solar flux level, now running in the 60s.
This level of solar radiation will provide us functional propagation, but
solar flux can jump into the hundreds. http://www.arrl.org/w1aw/prop/
[solar flux numbers at the end]

I'm no great DXer but I tune around and pay attention. (I have a simple
wire dipole laying on my garage roof for 20m, my usual hangout.) Just
yesterday, I worked two Japan stations and a Spanish station from San Diego
with 100W into that wire dipole. There were many others doing the same
thing and it took me quite a while to get those three in the log.

My point: HF still works at the bottom.

Don't mess up a good 20-meter beam.
And that 40-meter yagi must be huge! If its working, I wouldn't want to mess
with it, either.
You can make a 10-meter beam easy enough.
I could replace my pickup's hemi with a lawn-mower engine, but then how
would I cut the grass?

Makes sense. The poles of the Sun never stop turning or burning so
periodically
the arbitrary boundary must have fissures that allow for the escape of
low level neutrinos.
When equillibrium of the Sun is continous it means thje lights have
gone outand the pre historic human running for President
will be dug up in a 1000 years from now and the human race will be the
subject of speculation Vice president Gore will be dug up wearing only
a swimming costume and two fifty gallons of sun burn preventive and
living in an igloo !

Just the opposite. He was trying to discredit AC power by using the
electric chair as an example of how dangerous it was. Edison had a lot
of money tied up in DC generators and distribution. He didn't want
competition, especially from a superior technology.

From the high of the sunspot cycle to the low,
the energy output of the sun only varies by ~0.1%.
There's plenty of "charged material" even when
there are no sun spots.

hmm I thought not all the channels will necessarily change meaning
some of the vhf stations will still be there just switching from analog
to digital?

i have received some tv stations from about 100m away from
nyc in the catskill region, perhaps the natural elevation helped

but in that same area of ct i have also received ch 2 using
regular antenna however receving the ny ch wasn't the problem
the closer local ch 2 was more of an issue so pic wasn't
perfect

i used a regular but large radioshack antenna and coax

However, in very recent times, while the Earth was heating up, Martian ice caps also melted in a most unusual manner as did some other planetary bodies display signs of heating above normal levels. Increased Solar output? Would they tell us if it were so? I doubt it.

Anyone remember President Bush's press release in early 2002/3 that the government has decided that it will not inform "The People" if known dangerous phenomena concerning Earth and astronomical events were to be discovered? I do.

Last thing I read is that this last year's cooling wiped
out 100 years of global warming. Since the present cycle
temps peaked 8000 years ago, I suspect we are 8000 years
into the next ice age. Anything we can do to prolong
global warming will be beneficial.

You will be astonished when propagation comes back to life. I used to work
Austrailia daily with 5 watts FM into a dipole DFQ.

More than half of my DX cards were from chance contacts while I was
commuting to school. The other half was mostly from ARRL DX QSO parties.
Last Field Day I worked 1 Canadian as my only DX contact. Truly SAD. A
few years back I worked Asia on 50 watts CW and more than 100 DX contacts
despite a continuous pileups from band edge to band edge.

For the interlopers on 10 I suggest regular code practice sessions. Long
CQs from the keyer can help with that too. Rest assured they will be
drummed off when propagation comes back and the bands are full.

For the time being, there are rare opportunities. Learn about the beacons
and DX clusters. Some of us have time on their hands and some don't.

Interesting comment ... obviously the sub-conscious mind is doing overtime; as, when reading biographys' on both Edison and Tesla, one is struck by the seeming "psycho-nature-quirks" of their personalities. (I remember some words from the bible, I paraphrase, "The ways of God seem but foolishness to man.")

Perhaps a "necessary-character-defect" for those investigating subjects which more lazy minds ignore, and especially those involving electrical/electronic/wave-propagation?

It's already an FDA approved device, first application I've heard of
is pasturization of apple juice. Google PEF (pulsed electric field)
Diversified Technologies in MA manufactured the device. They're experts
in generating pulses for the DOD and seem to be venturing into new
applications now.

Gosh, QRM on 10? Up on the FM side close to 30 where repeaters are
used, which is hardly even used in the high portion of the cycle, I
have never heard enough stations to cause QRM! In fact I have only
heard just a few repeaters there since the early nineties.

Tell you what: Better the band is full of ham kerchunkers and being
used than not being used by hams at all. As I recall, demand by the CB
services is what caused us to lose 11m and it also could cause us to
lose 10m. Ten meters reminds me of Lake Superior in Wisconsin some
years after the opening of the St. Lawrence seaway. Lake Superior was
a thriving resource fishery at one time for lake perch and lake trout.
The opening of the seaway brought in the sea lamprey which killed all
the fish. With no fish, even the the lampreys died. By the 1970's,
Lake Superior was like an empty aquarium: No fish, clean and clear.
Unused. Empty and and unused like 10 meters today.

Gosh, QRM on 10? Up on the FM side close to 30 where repeaters are
used, which is hardly even used in the high portion of the cycle, I
have never heard enough stations to cause QRM! In fact I have only
heard just a few repeaters there since the early nineties.

I guess your radio's numb then. When the sunspot cycle kicks in it happens
every day. Skip causes way too much QRM because of PL duplication. It was
bread and butter for the radio company because so many customers would
complain and complain and complain about "other people using their
frequency" and they couldn't block them out with the mic hanger. Lots of
commercial users left low band FM for VHF and above because of that and
because a gain antenna needs to be so big that they don't last a year at a
repeater site. Ten and 11 meters is considered to be useless because the
daytime absorption is so bad it limits range to worthless. FCC made a
mistake to put CB on 11 if they didn't mean for them to play skip. And if
it weren't for modified CB's we wouldn't have a problem with interlopers at
all. As far as I know, most of the Ham Bands are useless for commercial
exploitation either because they are too small of a block like 220 was, or
because they aren't in the propagation sweet spot for a particular usage.
Hence, they are left to HAMS to experiment and toy with.

That doesn't mean we shouldn't be vigilant and fight tooth and nail when
some idiot tries to sell somebody onto our bands. The real shame is that we
LET GO of half of 220 just because UPS asked for it, and because a bunch of
newbie no-code techs that flooded 2 meters at the time had convinced

themselves FCC might cut 2 meters if they couldn't have 220. They were even crying to "take 440 if you have to, just spare 2 meters". If it weren't for that NOISE, the FCC might have simply denied the petition on recommendations from those in the know. So the Ham repeaters and control links that were on 220 either had to go away or move to 2 and 440 anyway. That was a boondoggle for everyone involved since most wanted to go to 800 anyway. It's been a money LOSER for everyone that invested in it. Now Hams can't get it back because there are a few ACSSB systems still there that customers got stuck with.

2023. Carolina Windom using 300 ohm ladderline

Newsgroup: rec.radio.amateur.antenna
Date: 2008-09-10 20:16:59 UTC
From: john Wiener <jawod@fuse.net>
Message-ID: <3bc02$48c82a8d$d844ba4e$32342@FUSE.NET>
Source record: 22697

I am putting up a Carolina Windom using ladderline instead of the
variant that uses ten feet of coax.
As an OCF the antenna should drive RF to radiate from the vertical
ladderline (coupled to the coax via 4:1 balun)

Odd multiples of the desired wavelength are recommended for the
calculated length of the vertical component.

I have 47 feet of ladderline and my question is:
Does it make much difference whether a low odd multiple or high odd
multiple of the wavelength is used. i.e., 1/3 lambda, 3/5 lambda, 5/3, etc?

I don't have direct access to EZNEC right now.

If you gotta flame, OK but at least this is question about ANTENNAS.

Hi John,

Your reference to Odd Multiples is incomplete. It is Odd Multiples of
quarterwave lengths: 1/4, 3/4, 5/4, and so on; otherwise every odd
number coming down the pike (3/7ths, 7/9ths....) would lead to unusual
claims that were wholly fanciful.

>If you gotta flame, OK but at least this is question about ANTENNAS.

Windoms, Carolina Windoms, OCF dipoles, and any number of names for
what the authors "think" represents the same antenna, is a can of
worms from the beginning (as evidenced by the Odd Multiples, a loose
reference you undoubtedly picked up from one of those seers). You
would get further if you simply state what you want to achieve instead
of trying to put lipstick on this pig.

Richard

Fair enough. You used the "L" word.

I want to use this antenna for 30M but also for multiband use.
Thanks for correcting my fuzzy math.

I have read several articles that state inferiority of the OCF to the
dipole. Perhaps they are misunderestimating?

Hi John,

You have a problem with too many references with too little knowledge,
I'm afraid. Of course my own posting could easily fulfill that
dilemma, but that doesn't stop me from proceeding.

First off, the OCF is a dipole. And here begins what would be a
pointless debate of semantics into the meaning, definition, and quest
for what a dipole "is." As a dipole, it simply has a different
feedpoint placement along its length.

As it happens, that same wire will resonate at very nearly every
harmonic no matter where it is tapped: in the conventional middle, or
to one side by whatever degree. What changes by shifting that point
is the match of resonance.

Over the course of time, some wag either brute forced worked it out,
did a model, or thought he measured it to demonstrate that a certain
sweet spot, in combination with a 4:1 BalUn produced an antenna that
was a most useful connection to a rig for little further tuning.

In some large part, that is true. The devil is in the details
however, and those details are rarely discussed by the sons of that
cult of worship. You may well already be aware that such an antenna
is prone to Common Mode problems (otherwise claimed as benefits by
those who couldn't solve them); and these problems are directly
attributable to the off center (or unbalanced) state. As truth be
known, nearly every dipole is unbalanced to some degree, so this OCF
is more so, and deliberately more so.

How do people reconcile using their own common dipole with its
unintended unbalance? Choking. Hence the same admonition goes with
the OCF, by that greater degree of "more so." Thus if you can
successfully choke it, the OCF could bring you all the claimed
virtues.

Now if you only knew the location of that sweet spot drive point....

If you got this far, we go to that length too.

> I am putting up a Carolina Windom using ladderline ...

Technically, if you use ladderline (or twinlead) it
is not a "Carolina Windom" and also not a "Windom".

I ran such an off-center-fed dipole 57 years ago
at Texas A&M fed with 300 ohm twinlead and a 6:1
Heathkit balun at the DX-40. It worked very well.

How do we want to use 10m?

1. Use it all the time similar to 2m using repeaters and some simplex,
or
2. Use it for DX but only during solar peaks which may be present for
3-4 years out of every 11 year cycle?

There are plenty of illegit users on our highways who use it for 1.
above. Purist hams prefer 2..More of the illegits than purists! If we
abandon the band for 7-8 out of every 11 years, you can be sure
someone will try to take it away, Think of all the channels they could
add with an extra 2 MHz. Think of the added commerce for Galaxy, Cobra
and even Uniden at the truckstops across the USA. Truth be told, 10m
most of the time is more suited for 2m style operation than 20m style,
again, most of the time.

2038. I bought the ferrite snap on filters

Newsgroup: rec.radio.amateur.antenna
Date: 2008-09-11 00:57:12 UTC
From: DES <BigELilE05@msn.com>
Message-ID: <e63d391e-436c-4f19-bc34-ec634bafbcbe@m73g2000hsh.googlegroups.com>
Source record: 22512

as suggested by some under the thread "Ham or CB Antenna?". (the thread about picking up CB and/or ham transmissions through my stereo and TV's) and they did absolutely *nothing*.

As suggested, I bought a few and experimented with them on my HT (home theater) system first since that is my major concern. I bought 3 "big" filters that would fit on my large speaker leads. (L/F - CC - R/F speakers). I also bought 2 smaller filters that would fit on the receiver and main power amp AC cords.

At first I placed one filter on each speaker at the speaker input and a filter on each AC cord (one on the receiver and one on the main power amp) No change

So then I moved the filters to the amp/receivers outputs. No change.

Then I disconnected the RF and CC speakers placed 2 filters at the LF speakers input. No change. Put one filter at the LF speaker input and one at the amps output. No change. Placed all three of the filters on the LF speaker lead. No change.

And when I say no change, there is absolutely NO drop in the transmission audio that I'm picking up.

So, now what?

AFA my TV's, the only TV that wasn't being effected (horizontal lines on certain channels) was my big screen that is hooked up to my home theater system. After some experimentation, the reason it's not being effected is because it is hooked up to a digital cable box. So, I shelled out the extra bucks per month for a digital box for the TV in my master bedroom. Can't afford boxes for the other two TV's.

Also, as a few of you mentioned, I do now believe that the person that is transmitting is in fact using a CB and a ham. I believe that I'm picking up his CB transmissions, and not his ham transmissions.

I NEVER hear his call letters. He's now using profanity on occasion. He sings to himself for 5 minutes at a time. Tonight he was telling "nigger" jokes. And he has now added some kind of device that allows him to transmit his voice with an echoing effect.

Anyway, all help will be greatly appreciated. I believe someone asked if I was in the US, yes I am.

Hi Cecil,

Thanks for that report.
Amazing how many different views there are of the Windom.

According to one source (K4IWL, Carlson):

Original Windom is a single wire feed OCF dipole

Carolina Windom is a twin lead OCF dipole with balun below the twin lead segment

New Carolina Windom is a OCF dipole to a 4:1 balun and a short coax length followed by a 1:1 unun (choke)

Each using a .378/.622 OCF feedpoint.

I think I'll just call mine the Wiener Dipole and be done with it :)

Money.

If you can afford to build a 20m parabola about 2,000 feet in diameter
and the place to mount it, you'll get lots of gain.

OK. What "really did work" for me in the past. A 100Mh choke in series with the "hot" speaker lead and with a 500pf cap across the leads just before entering the amp/receiver "box."

If RF is also encountered on your phone lines, a 0.01 cap across the leads at the "head piece", or ear phone unit of the phone ... if the rf is of a VERY HIGH LEVEL, the 100mh choke, alone with the cap, do it ...

NO crap, just what I found worked when I live next to a "high powered "CB'er", you mileage may vary ...

And, I know, these are cheap and dirty fixes, but THEY WORKED!

Cheap, unshielded leads/audio-amps are HIGHLY influenced by RF ... you get what you pay for. But then, you still have to fix the problem. :-(

JS

Then are you saying it is the antenna size that is the main factor?.
So my antenna which is physically small
can be focussed on a dish which would provide straight line radiation
or a radiation beam?
Working on a single element on the ground with a optimizer instead of
a half sphere I got a
straight vertical line at the sides which suggested a gun barrel
radiation with a perfect earth as the reflector.
Gain was around 8db vertical which is why the question regarding
focussing! If it was properly focussed the gain should be more.
2000 foot dish seems somewhat odd, probably based on a "straight"
wavelength and not a small volume in equilibriumas the directer
right?
Art

Let me ask the question another way. Whether it is believed or not,
if a 80 Metre antenna was compressed to the size of a couple of shoe
boxes
would the dish be reduced in size accordingly?

HF can be focused for gain. Main factor is that it takes a big antenna to
focus a signal on 3.5 MHz or so. Even a 2 or 3 element beam is too large
for most people , but it has been done.
To get any gain from a dish at that frequency would take a dish larger than
400 to 500 feet in diameter, maybe much larger. Hard to put that up a
tower.

Of course.

Everyone knows the gain of a parabola is directly proportional to
the size in wavelengths, or:

G=10*log k(pi*D/L)^2

Where G= gain in DB over an isotropic, k ~ .55 for most real parabolas,
D is the diameter, and L is the wavelength (wavelength and diameter
in the same units.

So a 2,000 foot parabola on 20m would have just about 58db gain.

No. The shoebox size antenna would approximate an isotropic if it did radiate. It would still have to be placed at the focal point of a very large parabola due to the size of the wave length. Such an antenna, I believe, on the island of Puerto Rico (the SETI antenna) although it is currently used primarily as a receiving antenna. That parabola is positioned to have a very high radiation angle and might not be be that good for terrestrial DX.

Hmm, when I use 14 Mhz and 6 decimal places I get 37; must have fat
fingered it the first time.

Working backward from 47 I get a wavelength of 21 feet.

Actually that is the Arecibo Puerto Rico Radio Astronomy Telescope. The
SETI project used it for a while but now has it's own antenna farm in
the US Southwest.

Hi John,

This (attached) should give you some sense of the rich variation of matching opportunities for the same length of wire under variations of tapping it with a drivepoint. The complexity of that data eludes simple discussion.

It sounds like you passed the audio cables through the center once in any of your various experiments. Try as many runs (wraps) through the center as you can manage. The effect goes by the square of the number of turns. That is, if one pass through is barely noticeable (yes, I am aware you noticed nothing) then 5 passes through the center will give you 25 times that effect.

You've already done the hard part of obtaining the ferrites, going these steps further is fairly simple.

Going a different way, I also get about 37.

Aperture of a dish is the area, pi*r^2. r is about 14.2 wl, so area
is about 635 sq. wl.

Aperture of a dipole is 1/4 * 1/2 wl = 1/8 sq. wl.

That makes gain 635/(1/8) = 635*8, i.e about 5100 or just over 37
dBd. This assumes 100 % illumination of the dish, which we won't
achieve. So make it 35 dBd or so, i.e. 37 dBi. Using the o.p.'s
formula, I get 36.5 dBi.

It's odd that pi is squared in the formula. The squared part must be
to account for the area of the dish, which is pi*r^2. Obviously, this
can has been compensated for by the choice of 'k'.

When dealing with problems of interference, it is best not simply to
'throw filters at it'. It might work, but a slightly more analytical and
diagnostic approach is usually more effective. From the original
postings (a couple of weeks ago), it would seem the OP has no expertise
in radio and electronics. I was therefore rather surprised when most of
the advice was 'go out and buy some filters, and fit them'.

However, the first mistake is when the OP adopted an adversarial
approach to his neighbour. Usually, the person causing the interference
is (a) initially unaware of the problem and (b) technically not at
fault. The diagnosis and successful elimination of the interference
often relies on the close co-operation of the two parties. The radio
amateur (or CBer) concerned may already be experienced in curing such
problems. There is now little chance of there being much co-operation.
Maybe a bottle of Jack Daniels might help?

Getting back to technicalities...
With a normal stereo hi-fi system, the most common cause of interference is that the speaker leads act as a dipole receiving antenna. Fitting ferrite chokes only works if they have sufficient inductance to kill the interfering RF currents. As suggested, a single turn through a snap-on ferrite is unlikely to provide much inductance and, because of the small hole, it is usually difficult to add more turns. [In fact, when I see these chokes already fitted to new equipment, I feel that they are more cosmetic than functional.] What really should have been used is the larger type of ferrite ring core (typically around 1.5" diameter, 0.5" long, with a 1" diameter hole). This is easy to wind with many turns of wire. [For optimum effect, it is useful to know which frequency (or frequencies) are causing the interference, as this may influence the choice of ferrite material and number of turns required. I'm sure that others will provide references and links to the relevant information.]

Of course, it is also possible that the interfering signal is NOT being picked up on the speaker leads. If this is the case, chokes on the leads are not going to help at all. You might need a choke on the power lead instead, or on both the power lead and the speaker leads. [Of course, you should usually fit the filters at the amplifier end of the leads.]

However, as I said, before throwing 'filters' at the problem, you should first have carried out a few simple diagnostic checks. These might include:
*Is there interference if I unplug the loudspeakers, and listen on headphones?
*Can I hear interference even when the equipment is switched off (honestly!)?
*Do the volume control (and other controls) affect the level of the interference?
*Is there interference if I unplug all external inputs?
The results of these simple tests may give a pretty good clue as to where the interference is getting into the audio equipment.

I do feel that the OP should try to enlist the help of the his interfering neighbour (JD?). Failing that, maybe some local radio amateurs may be prepared to help. However, he must remember that it is almost certainly HIS equipment which is 'at fault', and not the person 'causing' the interference. Indignation won't help at all.

> Original Windom is a single wire feed OCF dipole

A "dipole" is usually two wires with an insulator between
them. The original Windom was a single wire fed with a
single wire against ground. It's radiation was primarily
vertically polarized. The horizontal wire acted more like
a top hat than a dipole.

> Carolina Windom is a twin lead OCF dipole with balun below the twin lead

This is one I was ignorant of - sorry.

> New Carolina Windom is a OCF dipole to a 4:1 balun and a short coax
> length followed by a 1:1 unun (choke)

I didn't know the present one is a "New" one. My
apologies for my ignorance of the Carolina Windom
history.

P.S. IMO, they should not have called it a "Windom".

Whoaaa guys.....!

Let us think a bit more regarding the basics presented instead of
parrotting

dish's as used in the present state of the art.
Isn't a dish built around phase change of a half wave dipole in inter
magnetic coupling?
If I have a flash light that is focussed does this wavelength aproach
still apply?
I thought it would be a question of action and reaction. Trow a ball
against the wall and it bounces back
in a reflective manner to the angle of velocity.
A dish as presently used changes the phase of a given signal to
reverse it's direction.
In physics we can also talk about mechanical force that rebound and
rebound has nothing to do
with wavelength! If we consider radiation as being the projection
of particles instead of wavelike oscillation
then surely the size of the reflector is solely based on what can be
collected from the
emmitter such that it rebounds to a point or a focussed form ?
I ask the question as I know nothing about the reflective phenomina
of dish's tho I have visited
the one in P.R. where the dish is formed with the knoweledge that the
radiation spreads out
according to the emmiter used and thus when it reaches the reflector
the unit strength is weaker which the
dish attempts to reverse by refocussing. But then I could be totally
in error thus the question to the experts
Best regards
Art Unwin KB9MZ

Just to add to that, the idea behind the twin lead is that it is supposed to give some vertical radiation to "fill" in the holes in the pattern cause by the antenna being longer than a half wave at 20m and above. Seems like a not so good idea to me. I like the OCF dipole. I've had good luck with them. But they are not a "Holy Grail" antenna, just one more tool to solve the problem of what antenna to fill a need with. Also the ones I've built and modeled do not work well on 30m or it lest they need a wide range tuner rather than one that's built into the radio. One of the other myths is that OCF's don't need a tuner. On most bands they do.

I recently bought an automatic tuner (I know, I know; I wasted my money since manual tuners are so easy to build) which could supposedly tune "8-1000" ohms resistance. I first asked the manufacturer if maybe they meant "impedance", and they replied "Yes, thanks for the correction". That lead to a followup question:

(NOTE: My keyboard doesn't have keys for "plus or minus" or "square root" so I'll use "#" and "SQRT()", respectively.)

"Does '8-1000 ohms impedance' include ALL COMBINATIONS of #X#jY SUCH THAT SQRT (Xsquare + Ysquare) is in the range of 8 to 1000 (such as #8+j0 to #1000+j0 and 0#j8 to 0#j1000), or are there some "holes" in coverage?"

Their response was:

" We use the polar coordinate system and it covers all phase angles at 14 MHz. Obviously, plotted on a smith chart you would see the range decrease as you depart from 14 MHz."

I haven't used a Smith Chart since I was first introduced to them in college (1963!-() Could someone please translate their response to simple English that I can understand. In particular, what range of impedances might their tuner cover on 80 meters? 40 meters? 15 meters? 10 meters?

>What kind of filters are you talking about?

First, you have done a good job in locating a source of materials.
When I browsed around using the part number, I found this page:
http://dkc3.digikey.com/PDF/T083/P1503.pdf
which reveals your ferrite is optimized for frequencies that are much
higher than the ones used by your most obnoxious neighbor.

What you want is on the page before:
http://dkc3.digikey.com/PDF/T083/P1502.pdf
called out as Low Frequency (300kHz - 30MHz)
Cores for Round Cables part number 240-2287-ND which I chose not for
its impedance so much as for the largest opening. I did that because
these are not clam shell designs, and you will need room to pass
connectors through, and even then it might get tight for the 5 turn
specification. See the illustration and take note that you would be
passing two wires through as a pair, and doing this as many times as
you could within the constraints of fit.

Also, respond to Ian's posting, point by point as a way to give us
some feel for the actual location in your system that is most
vulnerable.

The reflector (or magnifier lens, take your pick) is on order of at
least 1 centimeter. The light wavelength is on order of 500
nanometers.

Ratio = 20,000:1

Beam is generally no narrower than 15 degrees. At a distance of, say,
6 feet, that beam would cover a diameter of 18 inches. Nothing like a
Lazer (sic) if that is the goal.

The k is generally called the "efficiency factor" which is supposed to account for diversions from the theoretical optimum.

From what I've read, it appears most real, well constructed and fed parabolas wind up with a k of around .55, which is why I used that number.

The response translates to: "The range is less at other frequencies than
at 14 MHz."

I see no basis for the inclusion of wavelengths when one is not using
a straight radiator
A straight radiator requires one type of reflector an array that is
condensed to a smaller volume
requires a reflector that is based on the propagation from that
radiator. If propagation flares out
then you can calculate dish size via WL. If propagation is of a
different form then
the dish must be designed accordingly.The important factor as I see
it is the mode of propagation
and what area is required at a distance to account for tha propagation
mode. If one starts with a
lazer then the reflecting surface need not be larger than the
initiating beam area assuming zero scattering.
Your thinking is based solely on the state of the art via reading
matter. You need to go back in physics
to the four forces of the standard model to analyse this question on
the basis of the unification
theory which is all conclusive where one can determine relative
ejection paths from the radiator.
The latter may well gyrate to WL I suppose

Again, your personal activities within the privacy of your own home is
none of our business and has nothing to do with antennas, or so I
would assume.

Actually, it is probably a complete breakdown from living in California and
realizing that ALL MARRIAGES IN CALIFORNIA ARE NOW GAY MARRIAGES BECAUSE THE
DATA BASES AND RECORDS HAVE STRICKEN ALL REFERENCES TO HUSBANDS AND WIVES.
It comes from the horror that they have all been grandfathered (gay raped)
without even realizing it. So it really has nothing to do with your
personal activities, it's all about WHERE YOU LIVE!

Hi Myron,

Their response _suggests_ to me that the tuner can match loads inside the circle on the Smith chart that's centered on the real axis and passes through R=8 and R=1000, when used at 14MHz. I guess that's equivalent to loads representing up to about 11:1 SWR in an 89 ohm line. They didn't exactly say that, but it seems a reasonable guess. It does seem like they denied that there would be holes in the coverage.

Other than not being able to match as wide a range on other frequencies, their response really doesn't tell me anything about the capabilities away from 14MHz. You might be able to nail them down a bit better if you can get them to tell you what range they can match at 3.5MHz and at 30MHz, or other frequency you particularly care about.

Cheers,
Tom

This should be a rhetorical question. There is no tuner on
earth that will deliver power, i.e. "match" 0+j1000 ohms.

How do we want to use 10m?

1. Use it all the time similar to 2m using repeaters and some simplex,
or
2. Use it for DX but only during solar peaks which may be present for
3-4 years out of every 11 year cycle?

There are plenty of illegit users on our highways who use it for 1.
above. Purist hams prefer 2..More of the illegits than purists! If we
abandon the band for 7-8 out of every 11 years, you can be sure
someone will try to take it away, Think of all the channels they could
add with an extra 2 MHz. Think of the added commerce for Galaxy, Cobra
and even Uniden at the truckstops across the USA. Truth be told, 10m
most of the time is more suited for 2m style operation than 20m style,
again, most of the time.

Again, 10 and to a great extent 6 also, are unreliable 7 to 8 years out of
the 11 because of the skip. As for the interlopers, When the band is down,
they will be using it, we won't know about it because we can't hear them and
they can't hear us even if we ARE using it. In fact we usually can't hear
each other when we are using it so how can you say it isn't being used.
When the band is up, then we can do something about it, but what good does
it do to trash the band with uncontrolled repeaters, so that we can't use it
either.

The thing is, it is a doable thing, but most people aren't doing it right.
You got to think ahead, think of the other Hams, and ask questions. Never
be afraid to ask as many different people because the only people who aren't
humbled are the newbies that think they know it all, but haven't done it
yet.

Actually, I'm all for remote bases in lieu of repeaters because when the
band is up, everyone forgets to shut down their repeaters so people can use
the frequency. Fully automated stations render us all obsolete. Another
possibility is to use Touch Tone Access to activate the repeater, which will
time out after 10 minutes or so if no one is using it, and forced TT
shutdown as well. This allows usage without leaving it to thrash by itself.

Antennas are a big problem. If you have mountain tops, Ice, snow and wind
kill antennas a lot and the large 6 and 10m antennas are by far the worst.
Several groups have 6 and 10 but every time they get around to replacing the
antenna, it's cool for a few months then it all goes down for a couple of
years until someone finds a good deal again.

If you don't have mountain tops, you are just as well to use VOIP links to
different home stations all over. This is like how FCC and Coast Guard

operate. They have base stations all over that they can dial into remotely. There are actually several Multi-Band, Multi-mode Ham stations already around that you can get in on with the right software and DSL line. You can put yours on line too. Google TS-2000 remote and look into that.

Look up IRLP too because there are repeaters and remote bases that can be controlled via IRLP from all over the world and some have 10 and 6 capabilities. Keep an eye on the beacon stations too or monitor 29.6 FM for band openings because that is where it's at. If you do have a multi-band mobile you CAN always QSY to 10 for local stuff too. Don't expect that to chase off any interlopers in the next town though.

> positioned to have a very high radiation angle and might not be be
> that good for terrestrial DX.

The antenna at PR has a stable reflector and a moveable receiver
thus the take off angle depends on the angular position of the
receiver
and the center of the reflector. The receiver is moved regularly so
the
sky can be traversed for listening. This was the idea when the antenna
was set up initialy by Princeton University before they gave up
possesion of it.
With respect to WL no facts have been presented to support that fact.
If you go back to the arbitrary border analysis a force thru the paper
of the center
of the border will present resultant forces around the outside of the
border representing
ripples on water in wave like fashion, that does not correlate to the
ejection
of a particle thru a fissure in the border. Mixing apples and oranges
no less

Not so!,

That is totally depended on the conditions assumed or assumptions made
such as the shape and size of the emmitter from which scattering of
radiation
can be calculated i.e. the shape of the cone if the scattering is
confined to a specific angle.
If radiation is determined from all four forces of the standard model
then the radiator can
be any size, shape or elevation as long as it is in equilibrium, thus
the "weak" force
must be taken into consideration. Period .
This also means one must think beyond the books
where radiation is a mystery and not fully understood by the masses.
Progress can only be made by following the Universal laws via first
principles
and not by selected extractions of formula from reading matter.
Don't they parrot that in the Universities of the U.S.A.?
Best regards unless you are in a nasty mood

Repeaters are normally FM, only legal from
29.51 - 29.7 MHz. What about 28.0 - 29.51 MHz?

10m simplex is not very attractive or functional
during the low of the sun spot cycle. That's why
it is not much being used today.

From 1650 to 1700, the sun went without sunspots.
It could happen again.

Thunderbird, with the addition of the addon "right click ignore" will
pretty much do what you want; however, you must right-click and pick
ignore for every thread you wish to ignore--a very minor inconvenience ...

2085. elevator noise part deaux

Newsgroup: rec.radio.amateur.antenna
Date: 2008-09-11 18:58:47 UTC
From: ml <m@di.net>
Message-ID: <m-002BC7.14584711092008@news.optonline.net>
Source record: 22459

hi

a while ago i posted hoping to get some ideas how to eliminate
some s9 noise caused by my buildings new elevators

only took them 9months to install some electrical filters but the
guy doing it was very nice and showed me a few things

since the filters didn't help seemingly at all, i wanted to provide
some more information and see what anyone might think would be
either some good tests to make and or further corrective actions

a recap, jan 08 we got a new elevator system the original 1940's unit
was just a rack of relays there are 2 elevators motor and stuff in
a small room rooftop noise was always s0 or s1

the new system i can see is made by galaxy believe it or not made in
the bronx ny i am told they are a large world wide supplier since i
live in the bronx at least they are local

my first look in there today shows they did at least take pride
in there work, all the wiring in there is really nice

there is kinda 2 main parts in the cabinet a large pc board and a
magnetek HPV 600

i took my ft817 shut the other elevator off and moving the rig
around i see i got no interference from the computer board getting
near the magnetek big time noise

they have the manual online
http://www.elevatorcontrols.com/downloads/files/hpv600.pdf

pretty interesting a section in there on how to mitigate noise
perhaps a few things in there i could maybe double check

when noone is using the elevator they throw out some noise like about
s2 maybe more when the elevator starts moving it jumps naturally
to about s9

i was wondering how to first see where the noise is leaking from
the metal cabinet is pretty think i say double the gague of say a
file cabnet , it does have slits on either side for air a few
holes for conduit which runs to the power and to the motor

they seemed to pay attention to grounding the door had a little
ground wire on it, etc naturally this is all fast first impression
stuff i didn't have a lot of time up there

i thought perhaps painting the cabinet w/rf paint and getting some screens over the vent slits thou obv that wouldn't help if it's radiating along the conduit didn't have a chance to measure for that

the magnetek is a bread sized box it gets hot and has a fan so i can't cover it, but perhaps a perferated copper/lead enclousure might help?(assuming it's not radiating along its wires)

as a last resort perhaps replacing the magnatek w/another brand known to be rf quite however i personally don't know how i would find that out and no garantee they would risk swaping the unit oout

so i am hoping that there might be some brainstorming and thoughts you all might share?

any advice tips much appreciated

thanks for all

Well, yes, I guess that's true as only those with an education in
electromagnetics would know that.

So I doubt many participants in rec.folk-dancing would know that, but
this isn't rec.folk-dancing, though some posters here do seem to dance
around a lot.

Well, I think that's cuz activity in general has been
declining. But 10m used to be very popular for
local use in this area, sunspots or not.
I imagine there are a few still out there, but I haven't
been on there myself much lately to know.

Read your own question. There is no such thing as a "straight
radiator" of light. There is everything to do with wavelength or you
could never see light.

Hi Myles,

One thing that I observed in the PDF you supplied was the Input Power
specification that states:
Line Impedance: 3% without choke / 1% with choke
Check to see if the input power is choked.

That was the point. I was explaining why you shouldn't open up a lot more
of the band to repeaters
>
> 10m simplex is not very attractive or functional
> during the low of the sun spot cycle. That's why
> it is not much being used today.

Well, I think that's cuz activity in general has been
declining. But 10m used to be very popular for
local use in this area, sunspots or not.
I imagine there are a few still out there, but I haven't
been on there myself much lately to know.

When the bands are down, activity is fairly local
I guess I didn't make it clear that you can't make blanket statements about
activity on the band just because you don't hear anything.
Did anyone read my post?

Yes Jim. Unless one accepts the weak force for what it is, what
creaates it
and what it does for overall vector angles discussion is moot. For
instance

the emmitter cannot be parallel to the axis of the reflector, it must be tilted
per the recognition of the weak force otherwise the mathematic and symbols such as
equal or zero are meaningless. You must begin with symetry or equilibrium.
You surely must know Jim that many hams do not have an understanding of
electromagnetics only on how a microphone is used or a particular part of ham
radio where their interests are,
The hobby is all inclusive and where one expertise does not necessarilly spill over to the other
except only in the eyes of the speaker

>My thoughts are with the reflector and it's design

Let's just confine this to light, wavelength, and reflection. Try
looking at yourself in a full wavelength mirror. It would be
somewhere between 450 and 650 nanometers wide or roughly the size of a
virus or bacteria.

Practicality demands a reflector vastly larger than that for simple
and ordinary usage. I seriously doubt you have seen a mirror smaller
than 20,000 times that size. Even so you wouldn't be able to see
anything more than your eye in it - or with advanced optics, your
face.

Would that larger mirror have any more gain that one that was one
thousandth its size? No, not to speak of in any practical sense.
Texas Instruments invented the DMD for today's projection TV systems
that use mirrors that small.... for one pixel of light. Their DMD
chip has a vast array of at least 1000000 of these mirrors. Most of
the light in the system is lost. Efficiency is thus very poor, but
that is not an economic issue.

In a way, it most conforms to the same issues of poor efficiency in a
small radiator: most of the RF power is wasted before it gets into the
sky. Unfortunately, for most practicing Hams, this is a very serious
economic issue.

Here's a practical challenge for the reader: Take a Christmas tree
bulb of 7.5W. Employing every trick of the trade of optics, how much
of that available power can you get into a 100 micron fiber optic?

You mean the weak interaction which is often called the weak force or
sometimes the weak nuclear force which is due to the exchange of
W and Z bosons and which affects all left-handed leptons and quarks
and whose typical field strength is 10^11 times less than that of
the electromagnetic force?

What about it?

previously i can say there was no chokes power went right into the
unit

today we installed the line filters they have some chokes

i noticed that line, in the manual, not really sure what it means
the power as supplied by con ed is rock solid as far as volts etc
power here is great

maybe i had a rough day , not sure what they mean by impedance
i mean i know what impedance is per say but not applied to 3phase
are they implying that say if one leg is %3 off phase or has
lower voltage or like a spike?

i also checked the pwm settings they were at default

thanks very much for taking a look Rich appreciate it

>
> Remove .spam.sux to reply.

No. You are referring to what Feynman brought about with his vector
scheme which analyses the progression of partical format.
The standard model of our Universe has four forces.
Gravity which is the weakest
The weak force a misnomer is the second weakest
The electromagnetic force and the strong force.
For a state of equilibrium all of these vectors must sum to zero.
The weak force can be ascertained from the sum of the other vectors
From Newtons law on action and reaction both the weak force and that
which produces it
is a combination of two forces that evolves from a single force.
Thus when you apply a time varying current to a non magnetic radiator
you also produce the weak force which is the Newton reaction force
which
is a rotating surface current which amateurs refer to as "skin depth"
which is not a homogenous
resistive skin but the Newton opposing current which is a requirment
for equilibrium.
When Yagi used a planar arrangement of parallel conductors parallel to
the ground surface he does
not include this weak force and just assumes that the arrangement is
one opposing the gravitational pull.
This is a good approximation but not totaly accurrate since the
arrangement is not in equilibrium which
is a requirement with respect to all the laws of the Masters including
Maxwell.
The inclusion of the weak force is the rotating force at right angles
ie the Foucault current ala skin depth
which is what a helicopter has at the rear to provide stabalization.
Thus when this force vector is added
to the gravitational force it tips the radiator as opposed to being
equal and opposite to the gravitational force
as is often surmised by physiscists. I t is this weak force that is
directed away from a radiator which also produces a magnet field
when in contact with a resting particle which has its own magnetic
field which was imposed on entry to Earth

and thus in conflict with the initial time varying field results in
the parting of the ways in the form of levitation.
When levitation is shown in experiments in high school you may
remember the difficulty of achieving stabalization
since the article levitated always want;'s to turn ala the circulating
field.
The above is How I see as the weak force in action with radiation tho
you will not see it in books as the weak
force has not been presented as I have above. Important note the two
vectors of the magnetic fields imp[osed upon the partical
creates a spinning motion as well as a elevating motion and it is this
combination applied to a static particle that profides a straight
line
ejection to the particle which is straight like the bullet of a rifle
and where the spin makes it impervious to gravity which is why some
tem it as a anti gravity force All the above is a result of my work
over the last few years and has not as yet been acknowledged as b eing
correct in the scientific world
unless an academic comes along with the same thinking for examination
an impossibility based on the not invented here syndrome.
A long answer to your question but a simple yes or no would not
involve sharing which is what I alway strive for despite the loose
mouths of naysayers

Because of my above findings I am comfortable calling the particles
neutrinos as nearly spent nuclear particals ejected from the suns
border
without spin which do arrive to alight on a diamagnetic material in
the Universe with varying intensity according to the suns 11 year
cycle
Best regards

Try reading the two again. They are identical. The only difference
is you don't know the magnitudes of those forces (the length of their
vectors) like Jim obviously does.

Gravity is abysmally pathetic where it needs several trillion tons of
earth's mass to keep us glued to the surface. If you were an electron
and earth was a proton, you couldn't survive being on the surface
without being crushed by the staggering electromagnetic force.

The Weak force, as Jim carefully explained, is only slightly more
powerful than gravity - which is to say feeble to 11 decimal places.

Hi Myles,

I'm not sure what that specification line means either, but choking is a standard term for reducing the influence of inductive kick, something those motors are going to do aggressively and spread RF trash throughout the spectrum.

However, in the context of motor controllers, solid state triacs can also be quite noisy and inject trash into the line. This has nothing to do with Consolidated Edison, except that they, too, could become annoyed with noise. However, they have a large industrial customer base that they serve, and they deal with it.

Returning to your desire to add covers, mesh, and the rest. I suspect that the metal casing already does what it should and requires no further attention. Instead, it is a matter of the lines that emerge from those cases that are carrying the noise. They are passing it along to you through two possible means: radiation or conduction.

If your rig shares the same power line, noise may arrive through that shared conduction path. This would be part of a ground loop. Barring that explanation, those lines are radiating like antennas, and their proximity to your antenna provides over-the-air coupling. This means you have to reduce that radiation (again, some form of choking, in this case ferrites) or you move to increase distance and enjoy the square law (10 times the separation pushes down the noise from S-9 to S-7 or something like that). Obviously, in your situation, choking is the simpler, and more effective solution. This will be choking that is an entirely separate issue from that one line in the manual.

I don't know what you are talking about
At the top I stated Gravity was the weakest force .At the bottom of
your post
you state gravity was the weakest force and the weak force was a bit
stronger,
again what I said.
So what are you talking about, a bunch of IFs. What exactly do you
want me to confirm or deny?

Industrial equipment is often rated in percent or per unit impedance.
http://en.wikipedia.org/wiki/Per-unit_system

For something like this, the impedance is probably mostly reactive. That is, 1% impedance means a PF of about 0.99 (well, sqrt(1-.01^2).. that is, you'd draw 1% reactive current.

I would venture that there are no TRIACs in that controller. It's a standard 3 phase IGBT based inverter drive. The default PWM frequency is 10 kHz, and you'll probably see significant harmonic content at multiples of that, although CE compliance means that they've filtered a fair amount out. There's recommendations on page 164 for line filters. You could probably check with Magnetek for details on conducted emissions with and without filters.

There is obviously a lot of confusion between some of the posters that
need to be corrected
Mention has been made of a bosun' and higgs field as something as
being factual.
In fact it is very contraversal an d is only a theory that has not
been confirmed≥
CERN experiments are trying to put something substantial behind this
theory but
nobody really knows the extent of a Higg field and nobody has caught a
bosun'
Feynman with his vectors took the notion that a additional particle
combination
provided mass, this at a time that neutrons were considered without
mass.
Feymans assumption lingers on inspite of the fact that it is now
proven that
neutrinos really do have mass. All of this talk is based around
something
that is not present on this earth, not seen thus not counted just
names
searching for a subject to be tagged upon.
Now we come to the subject of "wave length" as in radiation , the
subject of this post.
Wavelength only has meaning if a radiator only has two degrees of
freedom which means "straight".
But a wavelength can move in many directions and elevations such that
it has a shape of a sphere or worse.
To talk of something of" such and such" a wavelength does not pertain
to a straight line or a three
dimensional shape such as a cube or sphere so the idea of refering to
a wavelength as a linear length
is absolutely meaningles because one is using a three dimensional
object to describe a two dimensional linear dimention.
And for the last one I refer to Newtons law of action and reaction. On
this earth of ours there is no such thing as a single force
which is why Newton refers to "action": If one tries to pull a piece
of caramel apart there is not just one force at play but four fources
since one must include the right angle forces that is "necking" the
caramel at the center. Thus a force cannot exist in a straight line
but must include a rotational force for equilibrium. It is that action
which Newton is referring to and not a single straight vector
The confusion comes about when Newtons laws are paraphrased as a
"force" when it must state an "action"
My posting is clearly placed within the Earth's boundary so talk of

Quarks ,Bosun" Higgs field etc is clearly irrevalent to the subject
of radiation
unless it is a attempt to bait me or to create confusion about the
subject of radiation when its aim should be education and debate.

I wonder what the used at the focal point. Assuming a yago directed to
the center was impractical, next best choice would be a full wave loop
(in my opinion).

I think you cannot use the particle analogy with HF when dish size is
not >> greater than wavelength. For a small dish at HF, the waves will
simply bend around the dish and act as if it wasn't there. At much
higher frequencies, particle concepts become more accurate.

That is interesting. I thought the PR dish was parabolic. As a
parabola, the reflected waves (or particles if you will) of a
transmitter at focal point can only traverse in one direction, that
is, in a direction parallel to the tangent of a line drawn at the
lowest point of the parabola. If the parabolic reflector is
stationary, how can transmitted waves/particles go in any direction
but straight up in that perpendiculr direction? If you move the focal
point as you say they do, then the antenna does not finction as
parabola anymore and gain should drop drastically, agree? I am afraid
I must be missing something and request your technical advice. Thanks.

> What is the main factor that prevents HF radiation from focussing
> for extra gain?

1, Focusing the radiation involves using a parabolic antenna whose surface area is several wavelengths in length
2. Since our definition of HF includes frequencies between 1.8 Mhz and 50mhz, the physical size of the reflector required would be too large for the average ham to handle.
3. However, that does not prevent HF radiation from being focused, it just address the practicality concerning costs.
Therefore the answer is: There's nothing to prevent HF radiation for focusing for extra gain, as long as you build the antenna or beam in proportion to the wavelengths. If the wavelength is 10,000 times larger than that old TV dish, then simply build your "dish" 10,000 times larger, and in the same proportions.

The Arecibo radio telescope has a spherical reflector, not parabolic.
This is mentioned on the official web page:

http://www.naic.edu/public/the_telescope.htm

It also gives details on how the telescope operates.

2112. Modeling Hygain element clamps

Newsgroup: rec.radio.amateur.antenna
Date: 2008-09-12 06:12:13 UTC
From: Mike Lucas <w5chr@bellsouth.net>
Message-ID: <DInyk.28547$kh2.23950@bignews3.bellsouth.net>
Source record: 22486

I am running the numbers on several 10 meter OWA 6 element antennas
with boom lengths of 24 to 26 ft. Tools on hand are "Yagi Analyzer",
"Yagi for Windows" by Dean Straw, and the spreadsheets by W6NL.
Several designs look promising, but I've gotten myself confused about
how to correctly model the clamps. The official Hygain YO files from
Roger Cox are not consistant as to equivalent diameter or length in
comparing the 203BA, 204BA, and the 205CA.
"What's the problem?" you say. Well, I'd like to use the inboard
sections of some 204BA elements for the driven element and the first,
close-spaced director.
An email to ARRL Technical Services was not enlightening, and
re-reading Jim Lawson's and Dave Leeson's works did not give me that
warm, confidant feeling that I'd like.
Anyone care to enlighten me with actual numbers, or websites??
Gud Lk in the contest!

>I don't know what you are talking about

Two identical statements, one is yours. How is it that you don't
understand?

The electromagnetic vector for a 1V field imparts 100 Billion times
more force than the "weak force." This is why they call it "Weak."

The Gravity vector is weaker than that by far.

All of this has been known for years. The experiments at CERN are
merely adding precision to that number of 100 Billion to say it may
actually be 100.015 Billion instead (or perhaps 99.8992 Billion times
more force). This goal too, has been reported for years. One day in
the future they will know it to that higher precision which will allow
them to discern the finer degree of weaker Gravity's disturbance,
which, after all, is the whole point of this.

No one gives a shit about the Weak force. It is merely the universe's
S9+50dB noise from a 5th dimensional neighbor's aquarium heater that
is blanking out the S1 DX signal from a graviton.

>Art Unwin KB9MZ....xg

well, art, how dare you think we could be trying to bait you or create more confusion. i hardly think we could possibly create more confusion than you have right now. try to explain these for instance... if it takes that magical mystery particle settling on diamagnetics to create an electromagnetic wave, how does the sun which is all plasma create electromagnetic waves? and if the weak force is so much stronger than gravity, and it interacts with the multitude of these magical mystery particles that spew forth from the sun how come we haven't collapsed into a weak force black hole? it takes lots of mass to create a black hole because gravity is so weak, but if the weak force is stronger than it should collapse us even easier. and if the neutrino's well measured interaction with matter is so weak it must take a huge number of them to be your magical mystery particle so we should really have collapsed under their weak force a long time ago! oh wait, maybe their weak force is what does spin so we are really talking about a spindizzy effect that if captured would allow remote manipulation of matter, i always wondered where Blish came up with that device, maybe you have hit on the secret! come on art, the wx is going to be bad across much of the country here this weekend and we need some good entertainment!

David, what I have stated is based on known laws and phenomina and
started with the recognision
that applying a time varying field and radiators to a Gaussian field
equates to Maxwell's laws.
Right from the start you could not concentrate on proving or
disproving that statement !
Until you can determine whether that is correct or not you cannot
move forward.
As yet, nobody has disproved that statement with counter facts. If you
cannot explain that simple fact
you surely cannot understand Newtons laws and how the use of such laws
provide the presence
of eddy current which provides a skin depth of mechanical resistance.
I use the term mechanic
because I recognise the importance of the four forces in the standard
model and the Grand Universal Theory.
So until you are able to concentrate and tackle the Gauss and Maxwell
connection that I started with
there is no hope for you to procede in a scientific matter, and that
goes for every body, not just you.
Best regards
Art

Hi Mike,

I would say "have at it," but what has this got to do with clamps?

They cannot present any perturbation to the calculations that wouldn't be lost in the fourth right most digit after the decimal point. Even more un-compelling, modeling probably wouldn't get you any closer to reality than the second right most digit after the decimal point.

There are too many confounding properties of earth, nearby objects, and the usual variability in materials and construction to imagine you are going to both model and build one right out of the box, so to speak.

On the other hand, actually setting your mind to it and doing it is merely a matter of planning and performance right down to the size of the clamp nuts. This is nothing more than a geometrical description using wire sections of various diameters. The clamp is a half turn of a loop of a certain wire diameter, and the nut is merely a wider wire short section along the straight part of that half loop. Getting it to wrap around an even thicker wire (the boom), and pierce thick wires (the elements) will be a trick, and you will soon discover that you have violated at least one rule of the MANA engine (about proximity of, or overlapping segments). Myself, I would simply make the boom of a series of sections, where the clamp area has a slightly greater diameter.

This exercise is useful to do once for the drill. You get to learn what counts and what does not, and then keep only those lessons that actually offer something that lifts above the background noise of mathematical error.

Richard: Tnx for the post- I enjoy slogging through the math to 4 places, but then I usually round off to the nearest 1/16th when building something. My brain had become numb from particals (sic) with spin, dripping from tilted elements. I decided to restart a construction project, just on the odd chance that I'll get it finished and on the tower before (if) the next Solar Cycle happens. So why not some poetry or at least free verse next time???

around and around we go... i quoted the required passages from jackson and
ramo/whinnery/vanduzer to show that adding time to gauss'es law was
incorrect. the law is time independent, meaning it does not require a time
term, it applies for all time instantaneously and it is properly included in
maxwell's equations as is. your addition of 't' is not necessary. proof
is not necessary, it is by definition and intuitively obvious to anyone with
the proper background.

Hal
I have a antenna the size of two shoe boxes. This antenna is multi
wave lengths long
and will radiate on top band. In making this antenna so small I added
inductance
which I consequently cancelled as lumped loads have not been included
in the laws of radiation
as espoused by Maxwell. The opinion of this group is that I place a
reflector at a great distance
from this small physical box and call it a reflector!
I place this same small antenna upon the ground and with the use of a
antenna program
determine that I have produced gain based on a perfect ground. The
design on the antenna
is based upon the laws of Gauss since the laws of Maxwell has not
provided any impetus to the
solving of the phenomina of radiation . The laws of Gauss correlate
with each other and a person came on board
to verify such. But the trail that I offered has been rejected
Not.... because the association presented is in error
it was rejected by.....well.....well just because..... without
providing evidence to the contrary.
This has lead us to the obsurd present point where a cubic foot size

antenna for top band should have
its reflecter a couple of blocks away and of a size stretching for
several thousand feet instead of a few inches
where if the antenna was a ball of presureized water the close
reflector would prevent the jet of water spreading to the rear.

I have never built a yagi using Hygain elements, but I have built
some 6 element OWA's like you want to build. The effect of
the clamps will be larger than "4th digit", probably a couple of
inches at 28 MHz. But you can ssume to a very good approximation the clamp
will just shift the resonant freq of those elements by a certain amount.

When I built my OWA's I used DX engineering insulated element mounts. With
these, the SWR curve of the real antenna matched the tapered NEC2 model
perfectly. I didn't even need to adjust the length of the driven element.

If you were using a Hygain element for only the driven element, I would
just allow for a few inches of adjustment + or - (hose clamp on last segment),
and just adjust the tip length of the final antenna to get the correct
SWR curve. If you want to use Hygain elements for Dr and 1st Dir, just do
the same, but adjust the lengths of both Dr and 1stDir by the same amount.
In the OWA design changing the length of the Dr and 1st Dir is mostly
going to affect the matching of the antenna.

Since the "legal" ones either have a tuned circuit with takes the output
to ground and burns up the finals if you attempt to hit 11 meters, or a
choke which cuts drive at 11 meter freqs, or both ... I don't think they
can tell at ebay!

Most truckers actually use ham equip. (or, "legal equipment"), they just
have cut out the "protections."

So in the end, what good is all of it?

And, every ham I know, knows that if you want top dollar for ancient
equipment he/she is done with--sell it to a trucker! LOL

I mean, it is sort of like the "copy protection" on movies--it doesn't
work, teenagers worldwide copy and burn movies with free software--but
the industry claims it works! Go figure ...

I have no idea of how a photon affects radiation. I do know that when
a building is being drenched by a jet of water
you do not cover the building with a protective shield or reflector
you put a reflector close to the source.
You have to be the only guy in the country with a 2000 foot diameter
umbrella to keep your hair dry! You were the leader in this ham group
that denied the mathematics of the comparison
of Maxwell and Gauss. Because the rest of the hams on this group could
not handle the transition of the different units involved
or have not studied physics they followed you over the cliff like
lemmings.
All because you were exercising free speech where verification was not
available
I assume you know how to turn on a transmitter but beyond that your
education is a great mystery.
For sure you never received a pass in physics of any sort and debate
with such a person is impossible
I await the day when a ham comes along with sufficient education to
verify or discredit the Maxwell/Gauss
mathematics but I know a ham is not around in the U.S. that can
discredit it.

of course not, we are all educated enough to know the proper relationship
between gauss and maxwell, and the fact that gauss's law is an accepted part
of maxwell's equations... and works fine just as it is without your extra
't' added to it. it would take someone graduating from the warped art's
college of mystical electromagnetics with an advanced degree in
neutrino-anti-gravity-weak-force-jumping-particles to handle that proof!

not quite, but i do have a 120' tall by about 250' long 160m vertical array
and an inverted V at 180' that will beat your shoebox even without the amp
turned on.

>You were the leader in this ham group
>that denied the mathematics of the comparison

well, i did receive a bachelor of science and engineering in electrical
engineering cum laude from an ivy league university, but it was here in the
states, so that probably doesn't mean anything to you. And i did graduate
from the u.s. navy officers nuclear power school, which at least in some
areas was considered equivalent to a masters degree in nuclear engineering
at the time. but that probably doesn't mean anything either since it was in
the states again.

Given a 3 ft copper dipole on 1.9 MHz the free space gain is -4.6 dbi,
and exhibits a classic dipole radiation pattern. Placing a 6 ft diameter,
radial reflector 3 ft from the antenna has no effect on the radiation
pattern,
other than a slight reduction in gain to -5.2 dbi.

you really don't think art is going to believe that do you?? it is after
all based on a piece of software using maxwell's equations... which he has
said he believes in and that the software works, because it obviously shows
that his antenna produces a spotlight beam when you tilt it the right
angle... but he won't believe yours.

Ofcourse I do! it is very logical
You certainly must have a reflector that extends beyond the emmiter
dimensions
A dipole extends about 500 feet where as mine extends one
foot.!........Big difference. Like comparing a miniature light bulb
with a string of flourescent lights in an office building.
Has it quit raining yet? you seem to be all wet I think you need to
speak to the Navy and provide some of your expertise.
One Navy port has tilted all of their antennas for better performance
per the permission of an Admiral no less.
Do you know more about antennas than they do? This analysis is easily
proved per Maxwell equations so you should be able to
dispute what the Navy did. Why are they tilted? Because they are
including the "weak" force present in Maxwells calculations.
Is Maxwell all wet too? Computer programs based on Maxwells laws prove
it is correct so try Eznec for your self.
Tilt a long wire from vertical until it is fully resistive and the
field will show gain. You just do not have any clothes.

David you have had every chance of exposing mathematical error when
the proof
was presented on this newsgroup site. Every point of rebuttal
presented was shown to be in error
It was not provided by me but by a mathematician skilled in the trade,
with a doctorate, working on a NASA project at M.I.T
who came to my defence and showed the mathematical proof. Did you
report the good doctor to the Dean of M.I.T. and NASA
declaring him unfit as seen by your eyes. What credentials did you
present on your own behalf to provide credibility to your
observations ?
Did you mention your finding was based on..........well.......well
because.........well because it was me that said so.................
well I don't have to explain it to you.....................I KNOW HE
IS INCOMPETANT!!!!!.................YOU ARE A FOOL DEAN......

Sorry Mike,

Tilting untennas is suggestive of the crusades of the Man of La Mancha
and particals (sic) with spin remind me of Singing in the Rain -
derivative humor at best here, which is improved by decanting only for
the ranting author. Examples abound.

However, you can rest assured that using a couple of three syllable
words in a sentence is bound to be hooted at as being lifted from
Shakespeare, or undecipherable trappings of a foreign language. The
hayseed mentality is fairly distributed across the globe but we sure
get a unique crop cultivated here.

However, as I plunge into your suggestion, one quote comes to mind
from Herman Melville's "White Jacket":
"It is often observable, that, in vessels of all kinds,
the men who talk the most sailor lingo are the least
sailor-like in reality. You may sometimes hear even
marines jerk out more salt phrases than the Captain
of the Forecastle himself. On the other hand, when
not actively engaged in his vocation, you would take
the best specimen of a seaman for a landsman.
When you see a fellow yawning about the docks like
a homeward-bound Indiaman, a long Commodore's
pennant of black ribbon flying from his mast-
head, and fetching up at a grog-shop with a
slew of his hull, as if an Admiral were coming
alongside a three-decker in his barge;
you may put that man down for what
man-of-war's-men call a 'damn-my-eyes-tar',
that is, a humbug. And many damn-my-eyes hum-bugs
there are in this man-of-war world of ours."

No,No,No. I understand that Maxwell only used the Mathematics to
encapsulate
observations from about 28 contributors most of which were duplicates.
He never extended Gauss law of statics to express the mathematical
results that he came up with. Extending Gaussian law by adding a
radiator and a time varying field
provides all that Maxwell presented. On top of that it supplies
pictures where radiation can be
isolated and solved where as Maxwell only supplied numbers which
included the requirement
of equilibrium as stated by all contributors which is a reflection of
Newton's laws
all of whichcan be determined by transitioning from a static field to
a dynamic field he d.
Are you going to rewrite history?

Source record: 22372
Cross-posted to: rec.audio.tech,rec.radio.amateur.antenna

Hi:

What would be heard on a 40 Hz AM DX receiver that uses the most sensitive type of magnetic loop antenna? I doubt there would be any hissing since that artifact would involve high-frequency sounds and a 40 Hz carrier cannot transport modulation-signals higher than 40 Hz [violation of Nyquist theorem].

I also don't think power lines would have any perceptible affect on a 40 Hz receiver. In USA, the electric power has a frequency of 60 Hz -- in Europe, its 50 Hz. Since 40 Hz is below these power frequencies, I doubt they would cause interference on 40 Hz. If I was receiving at or above the power frequencies, I do think there would be disturbance but not if below.

Would any interferences from outer space be perceptible on a 40 Hz AM receiver? Galactic noise?

Thanks,

Radium

Yes it does. Navy recruiters were under so much pressure for nucklear
recruits that
all tuition costs were covered by the navy if the recruit promised to
serve.
When it came to graduation time they found out that the recruits had
not been tested for color blindness.
Pretty good gig for students but you had to work hard at school which
obviously you did.
Boeing by and large benefited from those errors by employing them.
What nuclear function did you serve in the navy or were you as blind
in color as you are in other things?

Where do they get "1000 Watt Amp"?

"Power Output (RMS) 350 Watts
Power Output (PEP) 650 Watts
Driven Power (RMS) 450 Watts
Driven Power (PEP) 1000 Watts"

Sounds more like an attenuator to me.

I once attended a CB shootout where they only measured
forward power, not power delivered to the antenna. The
higher the SWR, the better they liked it.

Oh my! It is in Maxwells laws, without the weak force you cannot have
equilibrium.
You are getting a bit silly now. There was a guy in this group who
stated that the weak force was ficticious.
He must be a submariner to. All computer programs based around
Maxwells laws have it to if one wants to
account for all radiation but most just want to design a Yagi because
it is easy to build.
Art

Yeah, screwy specs. Although I have never used this particular amp, it probably hits full out at ~40w-80w rms. That is what the small box amp they usually sell is for (most will have them when selling amps this big), takes 4w to ~80w then you drive the amp ...

I have an ancient CMI (has a Palo Alto/Menlo Park address and a couple of hams/engineers there built and sold them) which does a solid 80m-10m, 500w rms at 40w rms drive (I drive it with ~25w), pep follows the same linear curve ... it is marked "Amateur Amplifier" on the front panel and was purchased at an electronics surplus store in Livermore, CA in the 80's. I got it for next to nothing thinking I would have to replace one or more of the power transistors--it was only a diode in the thermal protection circuit which had failed ...

It seems quite legal to me, even though I know they were marketed to CB'ers in the 70's and enjoyed widespread "diesel usage." On a scope it puts out a beautiful signal on all the bands I have used/measured, however, as with any high power amp, the drive signal needs to be clean to excellent tolerances. However, I would entertain arguments on how it is "illegal."

I am guessing, but I guess it is the fact it spans 80m to ~40 Mhz which makes it illegal? However, when it was sold, I don't believe it was illegal to allow amps to cover the 10m and 11m bands ... but would have to research that now to make sure ...

Nowadays, I don't believe you can even buy an amp which covers the 10m band ... you must first "modify" the amp ... someone more knowledgeable on the fine points of the rules/regs would know for sure ...

My antenna on the pickup has been though h*ll, bent, dented, etc. (I have forgotten to fold it down on low overhangs), at one time the amp was operating into a 4+:1 SWR by the time I noticed (smelled something

getting hot, grabbed the unit behind the seat and burnt my hand!) It is one tough amp! I run a shortened 1/2 wave with a gamma match on 40m and a simple 10m SS whip, switchable ...

Regards,
JS

Most likely YOU would hear "Hab SoslI' Quch!" (your mother has a
smooth forehead!) as this is the command and control frequency for
Klingon Battle Cruisers.

Oh David I extended it to make it dynamic by adding a time varying
current where it duplicates Maxwells law
Find a ham who is conversant with physics and mathematics bring him
forward on your behalf for debate.
Tell him what you want debated say, what is stated above. Do that and
you will do a service for ham radio.
Warn him that the question as to whether a static field can be
transformed to a dynamic field quoting any book
that says you can't. He will then refuse to appear. End of story.
Art...is it still raining? Are you still all wet?

Possibly "bleedover" from some guy next door operating his subwoofer(s),
60Hz equip., noise, etc. ...

Why not just run a big loop of wire about and hook it to the mic/aux.
input on some old high quality/low-audio-freq. capable stereo? You
could catch all the "bands" from 20Hz-40,000Hz! LOL

Regards,
JS

> 73's
> Richard Clark, KB7QHC

thanks Rich, i think i need to confirm that theory thou it gives
me the willies

my gut tells me that box in the cabinet is where most if nt all the
noise is comming from and while its in a nice metal cabinet its not rf
tight just my gut

the left side has conduit going to the fuse box on the wall for power
on the right side 2 conduits , it goes up to celing almost makes a U
and down to the motor the other some sensor on the motor and break

the cabinet is very close to motor

one thing i did just realize thou it prob effects them more then me,
the guy showed me how they rand the 2 conduits to the motor one for
power one for sensor wires they were about 2 inchs appart he said if
they were in same conduit the'd interfere the manual says it
ougtta be 12" appart hope i am not in the elevator when self
interference occurs egads

the test i made so far was to walk up to the magnateck it was
obviously way noisy i walked over to the motor i didn't test
along the conduit and i didn't test w/the cabnet door closed

and along the cabnet ie the wall of it vs the vent holes

IF i could put some chokes perhaps on the power out put of the
magnatek, the filter unit they added was on the con ed power side
and i might be able to also add some chokes to the control lines to
the motor

what i'd really like to know is if that big filter unit they used can
also be used on the output to the motor i presume thats where the noise
is if it's wire related (my rigs on battery get same noise) i am
afraid to tell the guy to try it as that unit controls the motor
speeds breaking etc

i can only do this inside the cabinet since they are all loose
wires the motor is a sealed box

so assuming , they let me do that, and my test reveils noise
along the wires , what types of snap on chokes /material would
be recomened?

i wonder if they conduit is a 'poor' shield i could easily wrap that
w/rf tape

i can say the noise is s9 from 1.7mhz to 14mhz or so , and from
18mhz up to 28 it starts to drop to s7 on ssb it just sounds like
background noise on 160m or 80 am you also hear a particular
sound every few k that thing works much better as a wide band

transmitter than a motor controller below 1.7 practically no noise

the manual also states if it's default 10khz freq is moved it makes less noise i suspect the noise would 'shift' i wonder if it would possibly shift enought to be far enough i mean from 1.8 to 28 is a lot i dunno

on one hand it's kinda complex on the other it's kinda simple if i was smarter and had the keys /carteblanch to that elevator room

thanks again for all the tips

so you had to extend a set of equations that you say is giving proper results as they were written oh so long ago and have been implemented in all sorts of antenna modeling software that you say works just fine... so what did your extension do? if the software works as is without your changes to the equations then how are your changes necessary? what does your change to them predict that isn't already in there?? since you didn't write your own software, but are fond of quoting results of whatever you use, then obviously your change wasn't necessary and yet you rely on it... very strange... and no, its still raining and should be raining all weekend... so keep ranting... i still want to know about the neutrinos and how they settle on plasmas that are decidedly not diamagnetic and cause them to radiate.

hey, its our favorite troll next to art back for more abuse... you should
really talk to art, he'll build you a 40hz antenna that you can aim like a
laser beam and see just what you can hear. why don't you ask the elf
researchers what they 'hear' at those frequencies.

this might sound silly but it's still illegal to use bad language
and alot of the other stuff the cb'er is doing, if he is also a ham
that puts his ham license at risk as well

given how bad cb is, ie un policed, and how lax the fcc often is
in general it might be moot

but if all elese fails if for no other reason than to document it,
you can file a formal complaignt to the fcc

> True or false? prove it

Model parameters for sloping dipole: 60 ft at one end
13.3 ft at the other (45 deg slope). Horizontal dipole
at 60 ft. Length of both antennas 66 ft. Sloping dipole
resonant at 7.225 MHz, same length horizontal 7.3 MHz.
Average ground parameters: conductivity 5 mS/m, and
relative permittivity 13. Horizontal dipole maximum
gain off the sides (As expected). Sloping antenna
double lobed pattern with maximum gain at 80 degrees
either side of lowest end. Software: Nittany's GNEC.

Simulation results:

EL. angle Sloping dipole Horizontal dipole
(deg.) Gain (dbi) Gain (dbi)
10 -1.5 +1.2
20 +1.4 +6
30 +2.4 +7
40 +2.7 +6.4
50 +2.7 +4.7
70 +2 -0.6
90 +1.5 -3.5

Hi.
I am coming into ths discussion kind of late, but see no mention as to changes in the noise level as the elevator is operating or not. Is the motor and control circuit live all the time or just when the elevator is occupied or in motion.

As far as snap-on ferrite chokes, they must allow the largest wire to pass and should be fairly large for the low frequency involved.

Perhaps this has been mentioned before, but conduit will certainly radiate if it is not connected to a common ground point at each end. Otherwise, it is an antenna. No amount of tape will stop that. If connected to two "ground" points, the conduit could still radiate as a loop antenna. The building framework may make an electrical ground, but not an RF ground.

Do you have a portable am shortwave radio with an external antenna? Use it to explore (safely!) the wiring with the external antenna. I did this at home and discovered lots of HF noise coming from a VCR, DVD player and TV that were always on, but on standby. I think this exercise will let you track the noise a lot easier than your expensive ham rig.

Good luck!

Paul, KD7HB

>
> >Where do I pick up the money:
>
> the emmy's don't have money, just funny statues or some such junk... you
> aren't worth the cash, just a good laugh.

Excellent
pull up AO optimiser
Above ground
800 Mhz;inches

Put in xyz for centerfed wasvelength for 800 Mhz
Put in different numbers for xyz for one wire
Source is at the centre

a=1
aa=any number say 8
b =2
bb=any number say 10
c=3
cc=any number say 12
dia = 0.1 inches

vary aa bb and cc only this gives the program free reign to produce a
vertical or a tipped antenna without being
guided one way or the other.ie all numbers are different change entry
numbers if you like as long as there are no repeats
and let the optimizer run where it wants to for resistive impedance ,
max gain or both.
a,b,c are low numbers so the radiator does not drift in terms of
height

20 segments per half wave length should be enough. Impedance will come
out close to 200 ohms as a guess
AND MAXIMUM GAIN OR JUST GAIN OR JUST RESISTIVE IMPEDANCE....YOUR
CHOICE.

LET EVERYBODY KNOW WHAT YOU GET
Now you are on the hot plate at last.
Put up or shut up

Regards
Art KB9MZ......xg

I have found people using 27Mhz to have NO patent on "illegal/bad-language" (actually, I think you mean poor taste and uncouth behavior(s) ... something the ham community has NOT been vaccinated for yet, as proven by some members rabid behavior.)

I have no horse in the race. With the CHP out in full force to fleece bucks out of motorists, truckers come in handy in locating speed traps, "CHP Cameros", "bears in the air" (CHP helicopters/planes), etc. I doubt I am the only one "chatting 'em up" on 27Mhz ... I hear others.

Let's face it, the FCC and amateurs running down the freeway taking license plates, etc. are about as effective as the "homeland security scare tactics" used against citizens ... some are smart enough to figure it out, a few are not ...

Art

The antenna is resonant.

Input impedance: 84.8 + j 1.3 at 7.25 MHz.

Not that I regard resonance as having any significance other than
the input impedance is resistive.

Correct, as long as it is resistive. So what angle did the Navy tip
their antennas to achieve maximum gain?
They were not satisfied with the vertical antennas performance and
wanted something better.
So the question is what needs to be done to provide better performance
ie gain?
Yup they experimented in each and every way and fell upon.....what?
Even tho they cannot explain it.
David can tell you in less than 5 minuits which is the time the
program requires to provide the answer.

To it would be nice if physics was so tidy that there could be shown a neat relationship of the 4 forces, thus the birth of a new Grand Unification Theory. Einstein would have liked to find the unifying factor but he dies before he could accomplish that. He never claimed that there had to be a iuifier, only that physics was of such an orderly nature that it would seem consistent that there should be a unification.

Art is acting on the assumption that there MUST be a unifier. The CERN scientists postulate that some particle such as a theoretical higgs boson could be discovered and observed as the "God particle" that imparts matter to other particles which creates mass, matter being pervasive in the universe but mostly in its invisible dark form. From that they say that we could begin to study the relationship of this higgs boson to the other seeminly unrelated forces and find a grand unifier.

To me, the concept of a unifier is NOT something that necessarily has to exist. Maybe there is no unifier and in fact, the student of quantum physics does not see physics as being completely orderly as a student of astrophysics sees it. At the quantum level, the universe is highly random and probabilistic. Any forces we have identified at that level, and future forces we discover, do not have to be unified by any theory; that is not the way I see things either. I see no reason for scientisits to chase after this holy grail (other than by doing so at low cost and in their spare time so as not to waster resources) and I see the likelihood of anyone finding it at 10% at best. There is no observation or calculation that states a unifier must exist,

For all the good that will result in the future from the CERN accelerator, looking for a unfier based on new studies of a "higgs boson" (God) particle is a Hail Mary pass that in all likelihood will not succeed. Let's not be dissapointed when it doesn't. For HF antennas, most is already known which needs to be known by application of known EM principles, the study of which has infinitely less likelihood of pointing to a grand unifier as Art repeatedly attempts in these postings. However, he is doing it in his spare time and at no cost to society thus fulfilling what I think is the amount of resources should be expended in finding the grand unifier.

You would make a good politician: When you don't know the answer,
change the question.

He challenged you as follows: "please state the
equation and term that describes the weak force."

You answered: " without the weak force you cannot have
equilibrium."

I too am waiting for the answer to his question. Which of Maxwell's
equation(s) contains the weak force and show us specifically which
term defines the force. We already know that you took the position
that weak force is included in one or more of the Maxwell equations.

Tor:
Thanks for the reply. I've used home-brew plates and u-bolts for a
couple of
3 and 4 element 10M antennas, but all were grounded. The gamma match that
was
spit out by the YA program worked as calculated, and within the limits of
the equipment,
the measured VSWR curves matched the model.
While the subject line said "Hygain element clamps", I also have a box
full of Wilson
element clamps, both are close in appearance, but the Wilson clamps are
about
15-20% larger than the Hygain of the same element size.
First runs on an OWA for 10M used 3/4, 5/8, and 1/2 in. tubing, with a
bushing in the
element clamp to bring it down to 3/4 size. I was looking for flat gain and
F/B curves,
close to 50 Ohm feed, and use on-hand parts. I came up with a couple of
models that
looked promising, but I'm now looking at using 1-1/4 to 7/8 taper elements
for the driven
and first director. Since my optimizer is me, I haven't run enough samples
to tell if that will
show any improvement. What I have seen is that if a design is poor, a small
change in
taper schedule, element length or element spacing will make a noticeable
change in the
model characteristics, usually bad.
Plans are for a single 10M OWA here in Memphis, to be followed by a
3-high stack
at the retirement Ponderosa. I have also looked at scaling up to 20M, where
a 3 inch
boom prevents using the clamp style mounts. Sooo, thanks for the post, and
I'll
see you on the bands.

Very slow morse code. That's about the only form of AM modulation
that will work with such a low carrier frequency.

>that uses the most
>sensitive type of magnetic loop antenna?

>I doubt there would be any
>hissing since that artifact would involve high-frequency sounds and a
>40 Hz carrier cannot transport modulation-signals higher than 40 Hz
>[violation of Nyquist theorem].

Well, if your carrier frequency is 40 Hz, the highest AM modulation
frequency that will work will be 20Hz. That's also approximately the
modulation bandwidth. There are a few young individuals that can hear
down to 10-30Hz, but most people can't. It's a form of hiss, but at a
much lower fequency.

>I also don't think power lines would have any perceptible affect on a
>40 Hz receiver. In USA, the electric power has a frequency of 60 Hz --

>above the power frequencies, I do think there would be disturbance but
>not if below.

Think again. It really depends on your receiver bandwidth. For AM,
it's going to have a fairly wide IF bandwidth in order to work at a
40Hz carrier. Although power line 60Hz will not be directly coupled
into the receiver, there's probably enough gain after the filter to
cause some problems. It's difficult to tell without clues about the
rx gain distribution and antenna configuration.

>Would any interferences from outer space be perceptible on a 40 Hz AM
>receiver? Galactic noise?

Not outer space. However, there is a substantial amount of
atomospheric noise at low frequencies, mostly from lightning and
atmospheric electricity discharges.
<http://en.wikipedia.org/wiki/Atmospheric_noise>
That's one reason why it's not useful to build an extremely sensitive
VLF receiver. Whatever you're trying to hear, it literally buried in
atmospheric noise.

Not strictly true I think - depends on the modulation scheme - how else
do you think we manage to get 56K bps down a 3KHz phone line.

Cheers

> is occupied or in motion.
<<from being inside my house i can't really tell elevator
movement, i can say the noise is constantly intermittant, that is
on a few min off a few min, it 'seems' not to correspond to
elevator movement but i'd need a second guy to prove that

However being in the elevator room, as previously mentioned w/my
ft817 i can tell you the motor and magnatek is always slightly
energized however with no elevator movement the noise is
extreemly small soo as the motor kicks in the magnatek makes a
ton of noise same test standing ontop of the motor shows little
noise i didn't test the conduit

>

> Otherwise, it is an antenna. No amount of tape will stop that. If
> connected to two "ground" points, the conduit could still radiate as a
> loop antenna. The building framework may make an electrical ground,
> but not an RF ground.
<<yea that got me thinking i noticed the manual for the magnatek
actually talked about how to keep one end only 'grounded' and the

book was very good at explaning it, i have to go back up and see if
they did that i bet they sure didn't my guess is they didn't use
shielded wire to the motor sensor i'd guess iether plain wire or if
i am luckey

they have really only an electrical ground up their they did make a
single buss on the bottom and everything terminates at least to a
single point the conduit is 'grounded' by connecting with the metal
cabinet which is connected to that elec ground my building water,
heat, Ibeams and elec ground seem to all be at same potential and do
connect with earth soil, naturally the elevator room on the roof is
14stories high

i disagree with you however that 'no ammount' of tape would help if
the conduit was radiating copper or mu-metal, or lead or RFpaint
wrapped around the conduit and possibly grounded i think would have
an effect but i could be wrong my guess is it could work why do you
think it's not possible?
>
> Do you have a portable am shortwave radio with an external antenna?

> exercise will let you track the noise a lot easier than your expensive
> ham rig.
Yes the ft817 also has am but i've been testing ssb easier on
the ears and just a strong interference hihi

yeah it's funny how sometimes you find a vcr or a cable modem
that puts out so much noise on even standbuy a lot of companies these
days really are rf poluters and seem to get away with murder

I wonder if that magnetek is legal , just say the unit by itself
is it fcc approved to radiate such a strong signal so broad ??
second to that since it is interfering with a licensed ham station
per rules and regs would it be in violation? i wonder how i
confirm that ultimately i might hve to file a complaignt

not even worth opening the program. for I know that any time you let the optimizer run without realistic bounds and go for maximum gain you are going to get either and unrealizable design or something that no one would want to use anyway. that is what has been fooling you all along, you don't know the limitations of the programs you are using and taking their results as gospel.

you'll never get the answer. his only response last night was for me to try to duplicate one of his rediculous optimizations to get a tilted dipole. he doesn't know even the most basic math behind the equations, he has latched onto the gauss equation drawing (not the equation, just the drawing mind you) that shows the surface integration around a charged object and is doing everythign from that... the rest of it is made up from misreading, or just plain not understanding, other news articles that have some kind of percieved relation to em fields... for instance his latest fasination with the weak force is from the use of the term 'electro-weak' force, while this is well known to be confined to the nucleons in an atom he has extended it to his fantasy world to explain the tipping of dipoles over ground to get gain... my recommendation is to keep prodding him for fun, but ignore anything he says.

the other one that art has never answered is that if it takes his magical mystery particles settling on diamagnetic materials and then hopping around against gravity because of the weak force, why do my ferromagnetic antennas radiate so well? according to him they shouldn't have the magical mystery particles so shouldn't be able to radiate because all the current would be stuck on the inside of the conductors going back to the source instead of hopping up and down in joy with all those particles... come on art, explain that one in terms of your neutrino based weak force optimizer that you pulled off the shelf that was written by someone who ignored the weak force and neutrinos.

if you really want to have fun try plugging in a 40hz carrier with a 100hz
modulation and do the sum and difference frequencies to find the
sidebands... how do you explain negative frequencies?? are they going back
in time? taking information to before it was sent? or do they appear
before the signal starts?

Electro weak is what some continue to say for the weak force.
Assumption being that it is electrical nature and part and parcel of
another force.
When David does his thing with AO for himself he will inform you of
the angle of the weak force
and may even provide its magnitude. His series of questions and
statements stop here.
If I supply answers and he rejects implementation then we cannot move
on.
He is just baiting or he wwould tell you what AO provided. All have a
chane to resolve the question for themselves
thus relieving me of challenges as to my integrity. I cannot satisfy
anybody and they cannot satisfy themselves

of course i'm just baiting the troll... you have said nothing that makes
enough sense to even bother trying to verify it. i know that if i run the
optimizer long enough it will even give gain out of your shoebox full of
wire... that is just the way it works... and AO was really bad for that if
you didn't watch it and constrain it to realizable antennas.

>thus relieving me of challenges as to my integrity. I cannot satisfy

Resonant frequency about 7.335 Mhz
Resistance about 81 ohms
Max gain about 6.54 dBi at 30 degrees
I am INexperienced in using EZNEC and wonder if I'm doing something
wrong?

--Myron, W0PBV.

No, you are correct. I must have been asleep. Funny that nobody
else noticed my error. The difference in your results are probably
due to the fact that EZNEC does not use the Sommerfeld/Norton
ground model which produces more accurate results when the
radiator is near to the ground.

Ummm... Mr Radium clearly specified that he's using AM as in amplitude
modulation. If there were a different method of modulation employed,
methinks he would have specified it. You can get more bits per baud
out of relatively narrow bandwidths. The various HDRadio schemes:
<http://en.wikipedia.org/wiki/HD_Radio>
are good examples with about 40Kbits/sec in a 9KHz bandwidth. However,
they don't use AM.

Ian;

If it were possible to utilize 40hz at a high data rate it wouldn't take 15 minutes for the US Navy to send a 3 character message to it's submerged submarines. As for the phone companies sending 56kbps down a 3khz phone line. They use something like 4 descrete tones and phase shifts to do that and not at the rated speed either but something less as a practical matter.

Hi Frank,

It was noticed, but certainly not by Authur. I don't hold out any
hope of ever seeing him do half the work to show numbers to prove his
concept.

However, you are still asleep. EZNEC does offer you the choice of
Sommerfeld/Norton grounds, and you even get to define the
characteristics of that ground. This, too, is something that Authur
has no competence with, or let's just say he has refused to share
actual data there too.

As for the Navy using tilted antennas (suggested by an unnamed
admiral, Authur's usual anonymous authorities).... Well, I have been
invited aboard fighting ships in the last year. I have inspected
their AEGIS radars systems. I have taken pictures of their antennas.
If any one is interested, I could post some at my web site that are
absolutely beyond many correspondent's experience. They are not
tilted (an absurdity) unless a hurricane force wave slapped them into
the hull (not obviously evident by any evidence however).

Exactly, if I would strike my neighbor with a shovel, it would become an
"illegal weapon"; I would guess.

I've heard variants of this story for years, but have yet to see one shred of real
evidence that it actually occurred.

The closest I've seen that could be regarded as 'real' evidence was a memo that
circulated around PP&L (Pennsylvania Power and Light) back in the summer of
1972 or 73 that mentioned a farmer that ALLEGEDLY got shocks off a coil of
fence wire he was installing. (The power right of way went over his pasture and
the indication was that he was stringing a fence under one of the then new
extremely high voltage lines. 750KV if I remember, but maybe only 500KV.)

Even then, I thought the right of ways were 'clear' under the big lines, which
makes even this story suspect.

the electric field under ehv lines can be high enough to give shocks, especially if it were a long piece of wire insulated from the ground running along or across the right of way. There can also be other factors, magnetic induction is possible if the wire is long enough and he was closing a loop of it, like the top wire of an electric fence would be. There can also be ground currents due to imbalance in the 3 phases between substations, the currents induced on the static wire that is attached to the towers, leaky insulator strings, leaky lightning arresters, etc. the fields at ground level are supposed to be calculated into the design by the utility to be below the specified safe levels, but changes in ground moisture, air humidity, temperature, sag in the line caused by resistive or solar heating, can cause unexpected shocking experiences on the ground. where i used to work we would demonstrate that for utility engineers by setting up a worst case test line, having them measure the fields, and then do things like hold up a metal ribbed umbrella or touch a key to a car door lock.

note though that these are 60hz currents, the human body is relatively sensitive to that frequency and it is easily detected by most people. lf or mf radio frequencies are less likely to be directly felt unless they get high enough of a voltage/current to burn.

Thanks for the info Richard. Obviously any NEC based program
will have the Sommerfeld/Norton option. As for Navy antennas;
I have seen that they can be tilted, but only so they do not
get shot to pieces by the ships weapons. I too wondered "What
admiral, and in which port".

Yes, this can easily happen. A few years ago, I was doing some consulting work for a major power company at one of their very high voltage substations. EVERYTHING was hot, from the fence surrounding the property to the doorknobs on the buildings to the employee cars parked on the property. Even though this site was usually unattended, to a man, all the power company employees disliked pulling maintenance duty there.

> Even then, I thought the right of ways were 'clear' under the big
> lines, which makes even this story suspect.

What do you mean by "clear"? Yes, they clear the brush under their right of way (which can pass over private property) , but I don't think anyone has repealed the laws of induction and electrostatic fields. So, your story above doesn't surprise me in the least.

P.S.

When I worked for CBS TV, they also owned a 50 kW AM station connected to (at the time) a 12(!) tower directional array. At homes in the main lobe of the pattern, I can relate many stories of shocks off of aluminum siding, TV rabbit ear antennas, lights staying on, detected audio being rectified and coming through the forced air heating ducts, etc, etc. However, I never heard of anyone stealing power as related by the OP.

Mike- Tho this NOT about R.F., it is about induction- Many years ago,
we had a working telephone line, from K.Falls, Or to Tule Lake, Ca.
About 1/4 mile away a power line (1/2 Megavolt) was installed, running
next to our line for some 5 miles ! When power company fired it up,
instantly the line was unusable-- Measured over 400 VOLTS of escape
in telegraph office- worse- at a detector, a maintainer (these were
Fiberglass houses) grabbed on to the door handle, and was knocked to
the ground ! Power company supplied us with 60 cycle filters, but the
line still had too much noise to be usable! And, another incident- in
Portland, had a Phone line to Eugene, passed KXL (1190KHz?) radio
station- Had enough leakage, that it got into the baseband of our
microwave system!
we wern't using baseband that high, but when FCC inspected our El Paso,
Texas facility, cited us for re-transmitting that signal, on our
microwave system! Take it to the bank-- dumb things happen! Jim NN7K

KXL (5000 watts) is at 750 KHz. KEX (50,000 watts) is at 1190 KHz. If your system was anywhere near I-205 at Clackamas, then it would not surprise me that KEX would get into it. Once I was driving by their tower site and decided to be funny. It was in my 1969 Pontiac wagon. I commented to my passengers that "I bet I can really get a good signal from KEX right now.." and punched the button for KEX on my car radio.. which greeted me with total silence! I just happened to punch that button while in the strongest part of their pattern, and it took out the RF amp and local oscillator in the radio (damn, that was a good radio, too...)

Depends on your definition of AM. There are many types of amplitude
modulation, ask any radio amateur - and then of course there's VPAM.

Cheers

Ian

That's becuase the technology was developed ages ago.

As for the phone companies sending 56kbps down a
> 3khz phone line. They use something like 4 descrete tones and phase
> shifts to do that and not at the rated speed either but something less
> as a practical matter.

Multiphase AM schemes are common place; they are used in mobile phones
for instance. It's the old trade off between bandwidth and S/N just like
in FM but in reverse. Check out VPAM.

Cheers

Ian

In the past his "big discovery" was that, if you put the static charge
in motion, then at any instant in time the Guassian STATIC law still
applies. Then to make things worse, some scientist at MIT posted here
and agreed with that and that he took that as validation for his
entire theory. After he saw where the thread was going, the MIT guy
quickly departed the discussion and left the rest of us here to deal
with the Frankenstein he created. I think it was a type of academic
hazing of the group. From that came the pronoucement, validated by
MIT, that he was able to validate that the 'Maxwell's static equation
(the surface integral) also held true under dynamic conditions'! The
gravitational analog would be something like saying a ball maintains
the same mass at the top of the hill, as it does while rolling, as it
does at the bottom of the hill. Watch out that he doesn't counter with
relativistic velocities; the motion of charge on the antenna is
actually quite slow and in no way relativistic. Of course it is true
that the Maxwell static law would hold true for a moving charged
particle at any instant frozen in time and of course the MIT scientist
would agree with that (the MIT guy even said he had a computer
printout that simulated a moving charge and, arithmetically the

surface integral charge measured at an instant of time was equal to the charge of the electron...that made me suspicious of his sense of humor), but so what? We already know that motion does not deplete the charge on the particle. The charge on the particle is conserved. Static charge is not the source of the energy that is used (depleted) to keep the particle in motion. Maxwell already showed that in the rest of his equations. The fact that an electron maintains the same charge regardless of its state of motion and therefore does nothing to change the state of charge equilibrium has nothing to do with how an antenna works other than the antenna simply obeys Maxwells laws like everything else.

2223. 50 KW AM stations

You guys are all dupes who have fallen for "Radium"s
old tricks of asking insane questions and then sitting back
and laughing at people trying to make sense of them.

"Radium" is a notorious, long-time Usenet Troll. There
is absolutely no future in trying to reply to any of his/
her/it's questions.

Correct-- this from memory of around 35 years ago (Comm Tech for
Southern Pacific (Now Union Pacific)-- Main Line ran real close to their
towers! Signal came from a microwave carrier, installed as should be (
Balances wires, shield on one end grounded- had to ground BOTH ends,
to get rid of signal! Also had to string Grounds from the clock tower
at Union Station, a pretty good trick, as high as it is! Jim

Yeah, I like having nonsense fun as much as the next guy.
But "Radium" seems incapable of distinguishing between
nonsense and actual technical discussion. It just encourages him.

KXL has been 50 kw days at least back to 1972... that is as far as I wanted
to check it in the Jones Log and Broadcasting Yearbook.

http://www.davidgleason.com/Archive-Broadcasting-Yearbooks/1972%20Broadcasting%20Yearbook%20Radio%20Ohio%20to%20Tennessee.pdf

Interesting.
Record the signal, then play it back at different speeds (frequencies) using
different demodulator setups.
(Don't play it backwards - it says something about one of the Beatles that
way.)

Because it's not the *line* that limits the rate; it's gear at the
central office. Even so, 56k modems need to cleverly bypass some of the
CO stuff.

By using clever modulation techniques and error correction, a nominal
3600 Hz analog telco channel can manage about 32 kbps, but in that case,
the symbol rate (baud rate) is 2400 baud per second, well within the
passband of the channel.

Actually, the primary thing controlling VLF radio data rates is the
bandwidth of the antenna -- the signal just can't build up and decay
fast enough for a higher rate.

Perhaps you are speaking of another country's Navy with which you are
well-acquainted.

Having been intimately involved with US Navy electronics for over 45 years
(active duty 1962 -1982; civilian support in multiple capacities 1982 -
2007) I can tell you that our Navy has numerous shipboard and
shore-establishment antennas that are not resonant. Since flexibility in
frequency selection confers a tactical advantage, broadbanding is far more
important. Tuners and couplers of several designs allow non-resonant
antennas to work well.

The closest the Navy gets to resonant antennas is in some special
fixed-frequency applications, like IFF. Of course, antennas are sized for
the application and will probably exhibit resonance within their band of
operation, but that's not the design goal.

> the hull (not obviously evident by any evidence however).

Absurdity or no, a "stealthing" technique for the Arleigh Burke class
of destroyers involves sharply limiting the radar cross-section by not
installing vertical structures, including most, if not all, the antennas.

See this picture, which is typical.

http://en.wikipedia.org/wiki/Image:USS_Arleigh_Burke_Mediterranean.jpg

You can clearly see two pairs of tilted HF whips, one pair amidships and
another pair on the stern. This same stealthing technique is being
employed on the new LPD-17 class.

Some Navy antennas are mounted on tilting mechanisms which allow
them to pivot all the way horizontal, so as not to be a hazard to aircraft.
That's different.

So how does it feelto be a product of the projects? Section 8 has been
good to you since you have an internet connection huh.....fucktard!
Too bad your momma has to work on her back in the gutters to pay for
it.

> Mike- Tho this NOT about R.F., it is about induction-

I agree. And while I realizeit's quite possible to get 'shocks' off an induction
coupling that essentially goes to a high impedance, it's a far cry from being
able to 'power a house' with a broadcast transmitter that wasn't designed
for the purpose. Yes, Tesla lit up bulbs, in one case a reported 50 miles
from his transmitter site, but that was with a setup specifically geared to
transmit power with brute force, with fairly huge receiving antennas
specifically designed to pull the power from the broadcast wave.

And before someone brings up RFID tags... Tags are DESIGNED to work in
the RF field. They actually couple magnetically like a transformer to the readers
antenna. But realize how fast the field falls off and what limited range
they have.

But actually, in reference to the original comment, I believe IF someone did
pull power from the air, it WOULD degrade the broadcast signal.

Mike

These were shore based installations probably in Hawaii or some
island.
With respect to resonance, moving away from such as well as changing
from 15 degrees
(Frank's 30 degrees divided by two)
would provide a pattern of distinct advantage which the navy is
constantly looking for
For a whip tipped at an angle of 15 degrees can provide a forward
pattern of gain which can be a big deal
I anticipate that the navy will gyrate towards helical design where
the addition of a magnetic field will give a pattern of choice
together with resonance the size of a shoebox to reduce the number of
antennas on board.
Thanks for the info, it certainly was not silly As an aside the 15
degrees is the same as found empirically by Kraus

in the pitch angle of a helical, another example of the inclusion of
the weak force in a system in equilibrium !

You will never get it from me. You have done nothing for yourself or
anybody else on this group
so why should I do it for you? Why haven't you done the AO program for
the benefit of the group?
I know it will be embarassing to you but no more than your other posts
have done.
Carry on your fight against change and be among friends. Don't do the
AO program which
acknowledges the weak force that way there can be no change, Just
continue to be a talking head !

My original model was for a dipole tilted 45 degrees. The following
analysis is for a 35 ft ground mounted monopole with thirty-six 40 ft
radials buried 1" below an average ground of: conductivity 5 mS/m,
and relative permittivity 13. It is noted that the tilted monopole has
a slight gain opposite to the direction of tilt. The following comparison
is made in the direction of maximum gain. The F/B ratio is nominally
0.2 db, and the gain 0.2 db at lower angles. The measurement was
made on 7.2 MHz, and the input impedance 45 + j 47 ohms.

Take off Angle Vertical 15 deg tilt
(degrees) Gain (dbi) Gain (dbi)
10 -2.5 -2.3
20 -0.2 0
30 0 +0.3
40 -0.8 -0.3
50 -2.3 -1.5

Frank I am not familiar with your programming but the weak force is just that....weak
It is for that reason the Yagi coupling of elements provides a good estimate with easy structure.
For long distance accurracy is not a big deal but for measuring and for medical applications it is.
Art

I would say that they are in the typical sea-swept configuration, not
found on the Fletcher Class Destroyers of my duty, but mixed in with
the designs of, say, the later Barry:
http://en.wikipedia.org/wiki/Image:USS_Barry.jpg
Where you can nearly see two tilted HF whips, one amidships and
another behind the aft stack (actually both are behind their
respective stacks, as are the stacks sea-swept). The design of
reduced right angles is a staple in the "tripod masts." Obviously,
these 50 year old features were in place for reasons of their own that
were separate from radar silhouette considerations. Further, the
largest silhouette would be broadsides where the whips in ALL these
pictures are at 90 degrees to the beam.

I would also note that the Zumwalt Destroyer Class (as represented in
graphics) lacks any vertical whip antennas at any angle.

However, returning to my own recent shipboard experience and antennas
there, I will later today post a link to a dozen or so pictures. It
will include shots of Guss' Loops. I dare say several of these
pictures will provoke much head scratching (but only to those few
actually interested in antennas here in this forum).

Hi Frank,

The numbers hint of mixed polarization results which would come as no surprise from tilting which tosses in a horizontal component that was effectively suppressed by a true vertical.

The hint is the collapse of the overhead null, and the marginal differences close to the horizon.

The original story that I heard about 40 years ago is
that it involved 60 Hz high-voltage power lines. A
farmer is supposed to have built an induction coil
in a shed directly beneath the power lines and picked
up free energy.

Hi Richard,

There is some horizontal polarization. The peak
level is about 20 db below the vertically polarized signal.
Certainly sufficient to effect the overhead null.

Hi Art,

The program is Nittany Scientific's implementation of
NEC 4.1. I must confess I do not understand your
response. The weak nuclear force about 10^(-9) less
than the strong nuclear force, and its range is limited
to distances smaller than an atomic nucleus, so I
cannot see how it can effect the radiation characteristics
of an antenna. Are you saying you do not think my model
is valid? The results certainly indicate that tilting a
monopole by 15 degrees is pointless -- other than a
marginal improvement in high-angle performance in
one direction.

73,

Frank

No Frank I do not deal in baiting. Marginal improvement is not
meaningles in any stretch of the word
I have always kept equilibrium at the center of my discussions
which is exactly what all the masters did. It was the concentration

on equilibrium that provided me with the path and mathematics of the
weak force
a vector put in place by all the masters such that the addition of all
forces finished at zero.
Thus the masters knew all about it, included it in their calculations
as Maxwell did.
You can do the same thing by measuring the tilt vector.
For myself I was looking for a way to make small antennas that was
efficient
thus accurracy is important in my work which means inclusion of all
forces
such that my work was not built on sand. My work revealed the design
of SMALL
efficient antennas where there is a need for today. The weak force is
a side product that supplies
the missing partr for the Universal law theory which was not my
primary project.
I then used a computor program designed around Maxwell to examine the
new antennas
which it does in great style according to my expectations as well as
testing a
configuration for zero radiation which I found quite convincing All
this work represented
a lot of work, study and effort over the years so flippant remarks
from loose tongues has
no effect on me unless accompanied byknown statictics. If you are
beginning a path of baiting
it would be a surprise to me so I am delaying such thoughts.
Have a happy day

OOps I did not answer your nuclear question.
A static particle is just that a nearly depleted container of energy
with mass.
The arbitrary border around the sun is there as a line of equilibrium
where the inner forces are balanced
by the external forces. The sun burns so it produces by-products where
the energy that the burning removes
leaves only a half life of neuclear energy the accumulation of which
expands the arbritary bounday where physics demand
that an equalization of force must be established and allows the bye
products to escape. These particles have little direction in their
future travels

because of lack of spin needed for straight line trajectory. They can how ever receive energy by the entrance to a magnetic field but again without spin
it is determined to be static and thus come to rest on a material that will not absorb it into its own atomic structure. Earth is a structure where > than 95 %
of the structure will not absorbe the static particle. Now you mentioned full life of a nuclear particle and that to is released by the Sun in the same manner as other particles in what is known as a solar flare. Because of the considerable retained energy they can be very destructive when landing on a electrical network to release their energy prior to taking on a static form. There are many other particles emitted by the sun which collect in bunches where some of the particles have color which is a very strong binding force where its binding force is let loose by the impact of the Earths magnetic fieldn where the energy emmissions are readily vissible many miles south of the poles where the released particles fasten on to the minute droplets of moisture ever present in out atmosphere. Long answer some of which is at yet unproved and that is where CERN comes in. What fascinates me there is the ease that particles are "lost" to moisture droplets and the thinking that a vacuum and a low kelvin temperature will allow a continued trajectory but they have a lot of clever people working on that.

2263. Chart of HDTV freqs?

Newsgroup: rec.radio.amateur.antenna
Date: 2008-09-14 19:21:37 UTC
From: John Smith <assemblywizard@gmail.com>
Message-ID: <gajo85dju1@news.albasani.net>
Source record: 22336

Anyone have a URL of a chart of what the final HDTV freqs will finally be?

After viewing a dozen web pages from searches, I have more questions
than answers ... be nice to be able to plot a few different antennas.

Regards,
JS

We have a few words to describe such, here in America (well, real
Americans do anyway):

"Sticks and stones may break my bones but words will never hurt me." --
source unknown.

It dates back to about the time of our forefathers drafting of the
constitution, if not well before ...

IMHO, it could not be said better.

Regards,
JS

I found this chart:
<http://www.dtvprimer.com/DTVchannels.pdf>
It looks correct for the few local HDTV stations, but is certainly
preliminary. No clue on the minor-channel layout as that's the
stations business, not the FCC's.

However, the actual channel number and the displayed channel number
might be different. See:
<http://www.dtvprimer.com/freetv.html>
in the section on PSIP (program and system info protocol) near the
bottom. If you understand what's happening, please let me know.

Incidentally, another wonderful feature of PSIP DCC (direct channel
change) is the ability to pre-record a collection of commericals in
the DVR, and later shove them in your face when you least want to see
them. Since many commercials are played over and over and over and
over again, why use valueable bandwidth sending them more than once?

Isn't technology wonderful?

tipped at an angle of 15 degrees can provide a forward pattern of gain which
can be a big deal

Art -

The graphic linked below is the work of George H. Brown of RCA Labs, from a 1936 paper published in the Proceedings of the IRE.

It is a plot of surface wave field intensity vs.monopole height, including the distance to the "fade zone" where nighttime skywave radiation returns to earth to via reflection from the ionosphere to interfere with the surface, or ground wave.

In it please note:

1. Maximum field strength does not occur at electrically resonant heights of the monopole (that is, where its feed point terminal reactance is zero).

2. The characteristics plotted are not related to azimuth, therefore the performance of a broadcast monopole will not be enhanced by "tipping." If it was, AM broadcast stations would have been doing so starting 70 years ago.

JS I am just trying to explain physics and radiation is simple terms
for the layman
this does lead to mis characterizations in favor of clarity.
There is an example of garbled language submitted earlier today to
give the impression
of greatness in stature. A three dimension field was explained where
it provided gain.
The person went into uneadded information to decribe something like it
was a new revalation of science
where in fact it is totally meaningless with respect to related
context. Sure I am not the best guy in explaining things as with my
spelling
but I see no pleasure of infering the silliness of another person by
inflating my own significance by the use of a loose mouth,
Apparently others do !
When the new patent comes out I expect the same comments that I have
heard in the past
I knew that! everybody knows that. What use is it etc
Look to the past and you will see the outlines of the future
It would thrill me to bits if I was given an example where mathematics
proved me wrong as it would give me a reason to re evaluate things
a process I enjoy but that is not to be
Best regards

I have a old mercedes in storage and my daughter has a need for a car
and has asked for it so I have to replaces the deisel lines as they
have probably swelled and some other things. I think it is a bit of
cheek but then it will be nice to see it on the road again
My present deisel that I drive of the same manufacturer she says she
doesn't like.......Women come from Venus no less

"Immorality: The morality of those who are having a better time." -- H. L. Mencken

"Consider that language a moment. 'Purposefully and materially supported hostilities against the United States' is in the eye of the beholder, and this administration has proven itself to be astonishingly impatient with criticism of any kind. The broad powers given to Bush by this legislation allow him to capture, indefinitely detain, and refuse a hearing to any American citizen who speaks out against Iraq or any other part of the so-called 'War on Terror.'

"If you write a letter to the editor attacking Bush, you could be deemed as purposefully and materially supporting hostilities against the United States. If you organize or join a public demonstration against Iraq, or against the administration, the same designation could befall you. One dark-comedy aspect of the legislation is that senators or House members who publicly disagree with Bush, criticize him, or organize investigations into his dealings could be placed under the same designation. In effect, Congress just gave Bush the power to lock them up." -- William Rivers Pitt

"It has become clear in recent months that a critical mass of the American people have seen through the lies of the Bush administration; with the president's polls at an historic low, growing resistance to the war Iraq, and the Democrats likely to take back the Congress in mid-term elections, the Bush administration is on the ropes. And so it is particularly worrying that President Bush has seen fit, at this juncture to, in effect, declare himself dictator." -- Frank Morales
http://www.uruknet.biz/?p=m27769&hd=0&size=1&l=e&fark

"Right you are correct. Someone hooked me. I do believe in building relationships. That is what Christians are required to do. I am amoral. I am sure you know what that means. So are Scorpios. I am being 'protected' by the Formosa Rule because of my 'mental illness'. I am not targeting 'teh Mop Jockey'. You are and you are using me as a bait. Please stop. I have my own fish to reel in. Leave me alone. It is my hope that I will be able to catch a fish and reel it in for you. Once my retired bishop thought I was fishing for him and he took the bait, alas

it wasn't me and that spelled the demise of our relationship. Have a little bit more faith in me. An Eastern Orthodox bishop thought I was fishing for him and willingly, proudly and defiantly took the bait on public record, and it wasn't even me. Give me a break." -- Atlanta Olympiada "Erica" Kane yammered in
Message-ID: <ochc3.ag0.17.1@news.alt.net>

"It does to a certain extant physically and theoretically it holds even into the quantum but there observational confirmation is limited or non existent. That's the problem and the major stumbling block to field unification. For Dr. Einstein held out that a physical based field theory should be sought out and not left to quantum uncertainty of how the universe primly base works. Man made coordinate systems are fine without knowing from where or what is the base essence of what the space as deduced field is composed of, but not totally satisfactory. Anomalies keep space cropping up and scientists have to keep adjusting for these unexpected events. It's like a blind man that has memorized his physical surroundings to a point he feels very comfortable until that one new or unexpected event pops up and he's lost and fumbling." -- nightbat, in one of his more lucid moments.

I will look at the URL later Now I put the resonance as second to
equilibrium
as with equilibrium the need for a ground plane is negated In general
terms broadcast stations want equal radiation
around the point of installation knowing that the decibel is not
discernable in their audiance ears

That is what Harrison said. He also said we have one method of
radiation so why do we need another?
Brown had no reason to isolate horizontal propagation from vertical
propagation and because construction
is way more simple relative to Earth there is no reason to reinvent
the wheel. The Yagi method of radiation
is a very good approximation even tho it disregards the weak force as
it deals more with total gain versus the polarity

of the field. Present day science have more demands on radiation than
Brown would realize. My wife nearly died last year because of a slight
misdirection
at the hospital when a needle nicked the liver when the medical people
placed to much reliance on provided measurements that were beyond the
capabilities of the equipment. As science grows so does understanding
and so does use of radiation which has requirements
way beyond a radio station

"Now" that possibly you might understand that resonance of antennas is unimportant? (Let us hope so.)

Also note that none of the Masters which you continually reference has written anything whatsoever about any "equilibrium" needed for the efficient radiation of antenna systems, with or without a "ground plane."

Arthur -- please note that a vertical monopole generates only vertically-polarized EM waves in the far field. Brown had no need / reason to investigate or comment on h-pol fields from such radiators, as for the conditions of his investigations they did not exist.

>The Yagi method of radiation is a very good approximation even tho
>it disregards the weak force as it deals more with total gain versus

"Polarity" is not synonymous with polarization, Arthur. Please learn and respect the difference, if you wish your posts to be (somewhat) more credible.

What is happening is that many TV stations have been assigned a
channel on which to broadcast their new DTV signal prior to Feb. 17,
2009 while at the same time remain broadcasting their NTSC video on
their original channel. The chart shows these two channel designations
in the first two channel columns, and in the last column it shows what
channel the TV station will end up on when Feb. 17 comes around. As
indicated, some stations will be moving their DTV broadcast from the
temporary channel assignment back to their original NTSC channel
assignment, and some stations will remain broadcasting the DTV signal
on the temporary channel, which becomes their new permanent channel.

The masters addressed thge Universal sciences of which equilibrium was
a staple
They were on the opposing side of capatalism where diminishing returns
and politics govern everything.
>
> >> 2. The characteristics plotted are not related to azimuth, therefore

Exactly, a case of diminishing returns thus no funds for unknown
visits into science
A brordcaster accepts the drop out of listeners at the periphary of
their signals despite
the huge area of desired customers
Now radiation has expanded enormously into wireless operations where
diminishing returns rules the industry

since that industry cannot survive with a multitude of dropped
signals. Now "value" determines the feeding of science in an area that
the masters or George could not possibly have contemplated which
raises such statements of yours where your past is rapidly being
overcome by the desires of the future such that you would question the
need. Nothing personal as you are following solely the path of your
experience which has been satisfactory for you to thus the denial for
change. But again you are welcome to your own opinions as long as they
do not interfere with mine and contempt becomes active.
>
> >The Yagi method of radiation is a very good approximation even tho

> credible.

Yes that is true and is a fault of mine Those knoweledgable in the
field understand
that error because they are looking for the positives and not the
negatives.
But it does not diminish the value of the intent !. For example Wind
shear has come into prominence
because of tragic air accidents. Present day science relies on the
transmission of a polarised signal
where the reflected signal is analysed for distortion. Problem is that
the initial signal is contaminated
with other polarities such that the returns signal is doubly
distorted thus preventing accurate analysis
of wind shear. A small problem or observation of science for which
there is a immediate need which
can be helped by the observations that some would question the need
or veracity of. Credability is built on the memory
of prior stated positions usually put to memory of print. Credability
is always in question by those resistant to change primarily guided
by what is known with the credability of printed matter since they
take comfort in numbers.
Another point Nasa is very interested in the removal of moon dust or
particles from entering space craft. I read that they had partial
success supplied from the emmission from a capacitor. What they were
really seeing was an example of equilibrium of which I talk about
where they were only using half of the cycle provided by a tank
circuit which is one of equilibrium as with a full wave radiator and
the use of the weak field. So sometimes regardless of the perceived
need of the new or change it is knoweledge that is the real measure of
wealth on this earth since its true value never diminishes.
End of my input hopefully I have responded in a way that you expected
or hoped for.

2276. Equilibrium in free space

Newsgroup: rec.radio.amateur.antenna
Date: 2008-09-15 02:10:28 UTC
From: Art Unwin <ArthurUnwin@gmail.com>
Message-ID: <18384bb9-5c02-4ea4-afe1-3acb499d47c4@r66g2000hsg.googlegroups.com>
Source record: 22349

I want to share with you one problem that I have on the above subject
When placing a yagi in free space the computor programs supply a gain
figure
where according to my thinking the root cause for ejection is the
intersection of two magnetic field.How this happens with a yagi is a
matter of conjecture. Any pointers?
Performing the same with an arrangement in equilibhrium there is no
gravity and yet gain is shown. This leads to four posabilities
! in the absence of levitation ejection is provided by the sliding of
the charges at the radiator ends as with corona in a vacuum. Problem
no spin applied
2 With a coupled antenna, yagi there exists two magnetic fields that
intersect where the charges again because of the absence of
equilibrium the charge again slides off the end Problem again no spin
applied
3 The programs have been modified from inception where the only rules
involved were Maxwell's laws which was then modified to correllate
with pre conceived known facts
4 The concept of initial reliance on equilibrium as preached by the
masters is incorrect and my reasoning is in error
I do not know the answer as I am not skilled with respect to the
algerythms used but the unknown can supply ammunition for loose mouths
until it is resolved
One thing is certain, Gauss states that static particles cannot
radiate in free space as there is no exchange of flux
and Maxwell includes the vector associated with the weak force where
gravity is non existent or zero !.
Best regards

You've just unvailed the dirty secret that antennas don't work in
space and that all the so called communications with Appolo, Pioneer,
Mir, ISS, the shuttle and all telecommunications satellites is faked.

Now you had better be on the watch for the black helicopters for reveling
this.

The ARRL was founded in 1914. Radio Handbook before that? Seems doubtful.

But 'Lindenburg'? Who he? You must mean Lindbergh, whose flight was May 1927.

No. But the new pictures of light-waves do suggest they travel a medium
which exists, EVEN, in space, and yet, unseen to-date, and end up
"striking" the antenna(s) in question ... but then, most have always
accepted waves need a "medium" to propagate on/in ... but then--assign
it the name "either" and grown men cower in the shadows, in fear! ROFLOL

Not bad, but still a pile of garbage. Your word salad reminds me of
papers submitted by student who didn't have a clue what they were
doing and simply threw every buzzword they could remember into the
report.

Did you use an online technobabble generator, rant-o-matic, or created
it by hand? If online, I would be interesting in the URL as I have a
business plan to re-write.

Incidentally, if you're trying to regain your equalibrium, I suggest
that lay off the booze. Also, if your antenna is performing
self-ejections, you might want to tighten the mounting clamps.

No I have not invalidated the concept of radiation in space since I
cannot rule out the root cause of the phenomia of
two insecting magnetic fields At the same time I have little belief in
the total veracity of antenna programs because of assumptions made on
preparation
I also suspect that the expansion to rediation in free space was
concluded without due consideration as the programs depict the only
change as zero reflection with the absence of earth with out
consideration to other factors. I am not denying radiation in out
space cannot exist only that I do not know how it is created without
influence from outside or added forces. At the same time there are
more indications of correctness in my analysis via well known
phenomina than the puzzle that I have present. I rely only on the
logic presented by other people which I have no reason to discredit
most of which have stood the test of time. The computer programs were
based on the laws of Maxwell so assumptions should not have been
necessary nor the revisions made over the years One assumption is
clearly in error is based on sino soidal current flow where a full
wave radiator is considered to be a tank circuit
where energy is moved via pulses, obviously I am missing something
here as well as the mathematical constant of subtraction for free
space.
There is a problem but the root cause is obviously unknown thus my

theorem should not be discounted Formulas formed by Einstein on relativity have included the same laws of Maxwell who includes the weak force which is nothing but a vector at the present time such that all forces equal zero. The latter was chosen as a fact thus there was no option to conclude that the gap created via vectors was a unidentifiable force often stated as an anti gravitational force thus without gravity all forces must change to conform to equilibrium, something I cannot accept per Gauss.
Jim, I am just being honest about my findings and at the same time pointing to areas of disagreement by the unknowns that are presented. Only the test of time is of value as more knoweledge is accumulated

> up free energy.

I've read that typically 1/3 of the current in a multiple ground
wye connected transmission system returns though the earth.
Seems a shame not to pass it though a few lightbulbs as it
passes by!

There was a story just a few years ago about a farmer that was
obtaining power from a fence running parallel to a transmission
line. He went to court and eventually won his case since this
power was already lost in the return resistance of the earth
and the power company failed to contain the current within their
transmission line. I can't recall what he was doing with it.

There was a room in the building of my last employer where no VDT
would function properly. We had a survey instrument in the EMI lab
so we gave it a try. The 60Hz magentic field in that room was intense.
We pulled down some ceiling tiles and found a large steel beam that
spanned the length of the building went to ground there. The beam
was parallel to the transmission line about 50ft just beyond the
outside wall. There was a substation was about 250ft away. I'm
sure the beam was grounded at both ends. Seems like the orientation
wasn't best for inductive coupling. Could have been carrying some
of the return current. A rough estimate of the current had it in the
hundreds of amperes. I can't account for it. Strange but true.

Later I heard from a former coworker who got a job with Super
Computers Inc then spent his first year mapping the "stray voltage"

at a site before they built their facility there. They found it can cause problems with their process instrumentation.

John the problem as I see it is how the magnetic field is bestowed on
a unbound particle
that is not rejected by the Earth"s magnetic field but allowed to
ecape from the Sun's magnetic field
. It is this I have no explanation for
and despite all reference to garbage nobody can supply the true
creation of radiation.
More light needs to be shed on the subject of space. to determine what
one calls garbage
because of a compressed field of knoweledge where another without
those constraints see it as a treasure.
I have a strong suspicion that scientists have assigned diiferent
names based on the theory assigned to one
many of which there is no evidence of their existance
Best regards
Art

Test Preparation Software

Pass your US FCC ham radio license test with ease. Our test preparation software serves as a training aid to help amateurs and prospective amateurs pass the
VEC's administered test. When you can consistently pass the test given by our test
preparation software, you will almost certainly pass an actual test.

Our ham radio license test preparation software uses the latest officially released VEC's approved question pools. The program breaks the test into different sub-element. Integrated into the software are illustrations and Part 97 rules pertaining to the current question. The program tracks the progress of the tests taken. Once you have mastered each sub-element you are ready for the official test.

Visit our web site at http://www.hamradiolicense.net for more information

I used to have the nomenclatures of all those antennas memorized, but, alas,
having gotten away from EMI inspections in 2003 and having fully retired
last year, all I can call to mind is the AS-2815/SSR-1 (your "Drooped Cross
Horizontal")

You zeroed in on some cryppie antennas. I rocognize the biconical dipole,
an HFDF antenna and a Rubicon antenna. They're often found together on an
Aegis cruiser. (Makes me want to put on my coveralls and get back out
there -- or maybe not.)

There is actually a LOT in the few words above, it is deceptively stated--although, perhaps, without intention; had to really think about it a bit:

I quite agree with the fact that what you refer to as "have assigned different names [to] ..." is/are at the center of what you speak, what the "either is" and what the Hadron project is about to attempt to look at, in greater detail ... indeed, it is where the "new knowledge/discoveries" are about to emerge from (if there is any chance that will happen--at all.)

Hopefully, this all will end up pointing at new ways to design antennas to take advantage of "its'" (the eithers') properties. And, is an area adjacent to, in the very least, the one you are in the process of contemplating/imagining ...

The earths magnetic field (indeed, any static/changing magnetic field for that matter), gravity, suns particles/emissions/etc. all depend on the "either" you place in question; when you sprinkle iron filings on a sheet of paper and position a magnet below--this is what you look at; I believe it is also what is referred to as "the weak force" (or, is intrinsically related), but talk about a misnomer!

We just spin our wheels with little progress ahead ... but then Einstein even referred to it as, and I paraphrase, "un-comprehend-able!"

But then, perhaps some of "these things" are just shooting bullets (particles) as some picture the "particles." One must acknowledge this, although I have come NOT to "believe it", at this point.

We can't know until we really "know", and even then we may have yet to "prove" it; and, therein lies the real problem(s). For now, we must face the goons who poke fun at men and women who wonder, and dream, yet are certain "they" know SOMETHING EXISTS THERE.

You are correct to focus your vision(s) towards the Hadron project ... it is at least one hope of vindication! :-(

And, even if you still do not see the either as I do -- you will "come 'round!" <grin>

Regards,
JS

Hi everyone!

Anyone know of a nice club or hangout in the Toledo area that caters to cross dressing radio operators? I'm a guy from Toledo who enjoys showing a submissive man a good time in every way. I have so many interests that there probably is some broad common ground between myself and about anyone. I love to talk about BDSM issues and interests, and have been generally regarded as a funny guy to hang out with who has a good head on his shoulders. Send me a message for anything else you'd like to know!

I've attatched a link to my picture below, I consider myself a BBW trapped in a mans body and will be dominant to the right gentleman. (ham radio operators move to the front of the line)

Cecil, if one follows the above url to electroweak interaction it
states the connection between electromagnetic
and the weak force interactionas emminating from a single force ie
weak force is part and parel of the
primary force. In radiation a time varying magnetic field also creats
the circulating field (parity of forces).
such that eddy currents matches the description inferred by the above
electroweak interaction .
Personally I see both interactions as being one and the same thing. In
the path to this segment it infers the weak force
is also in free space and it is that I do not understand, as the root
cause of action is the intersection of two separate
magnetic fields and the amalgamation of two forces producing a
triangle of forces summation
in three dimensional form (three movements of freedom required for
stabalization).Thus the mystery is how two magnetic fields are created
and more important WHEN !

... and some stations will be transmitting DTV on a third channel (not the present analog nor the present DTV channel)

I have also found that a number of stations have applied for changes (so far they seem to be ERP changes) to what is contained in the eighth FCC report of March 2008. One needs to go to the FCC site and enter call sign of each station to find the present information.

A surprise to me is that the coverage contour for analog TV is 64 dBu and for DTV is 41 dBu - a difference of 23 db. However, the reductions of ERP do not seem to be that large. Stations that are now a bit weak may be unusable after Feb. 2009.

Hi Jerry,

I built a model of it, and from by guess and by golly, I presumed it
would be somewhere in the middle of the VHF/UHF Shipboard Band
(225-400 MHz) and made it resonant at 300 MHz (arbitrary selection,

mind you).

Let me know if you want a copy of that file.

What about VLF communications from submerged submarines? They work at, would
you believe, Very Low Frequencies, a lot lower than 20kHz.

There were more antennas to select from for posting, but they
inhabited higher frequencies and had less obvious structural elements
- like one I stood next to while the crew manned the rails. Not
crypto, per sï¿½, but one of those spook traffic sniffers that was the
size of an industrial washing machine, sitting on the weather deck of
the forward superstructure. The CT Chief standing next to me pointed
it out.

The shipboard shots were either the USS Bunker Hill, or the USS
Princeton, AEGIS cruisers as you have already said.

Understand that free space is not empty. There
exists a quantum structure about which not much
is yet understood. Google "dark mass" and
"dark energy". Everything that we can see and
measure appears to be about 5% of what exists.

>> that it involved 60 Hz high-voltage power lines. A
>> farmer is supposed to have built an induction coil
>> in a shed directly beneath the power lines and picked
>> up free energy.

Hmm.. a bit of physics..

Induced voltage is Nturns*dPhi/dt
dPhi/dt -> change in flux (Webers) per second

Flux is area of coil * B field.

AC field under a HV power line is typically around 1-10 microTesla.

So, the peak flux through a 1 square meter coil is about 10 microWeber.
At 60Hz, the maximum slope is 2*pi*frequency, or 377, so now, we're up
to 377*10E-6, or 377E-5 or 3.77E-3.. about 4 millivolts..

Now, lets assume a coil that's 10x10 meters.. that's 100 square meters,
so we're up to 0.4 volts, open circuit voltage, for one turn.

Now, let's say our ambitious farmer winds 100 turns.. now we're up to 40
Volts. But, that coil is 4000 meters of wire (100 turns * 40
meters/turn), and will have non-zero resistance. Let's say our farmer
used AWG 10 wire. about 1 ohm/1000 ft, so call it 13 ohms all told
(4000 m is approximately 13000 ft).

So we have a source with 40V open circuit output voltage and 13 ohm
output Z. If we hook up a matched load (another 13 ohms), it will have
20 Volts across it, and dissipate about 30 watts in the load and 30
watts in the loop.

Now, at $0.10/kWh, and 0.03kW, that's about $26/year

Of course, there's the labor in building that coil.
And, the cost of the wire. (400lb of copper at $3/lb is $1200)

Sure, you'd use aluminum wire, so you could cut that down by a factor of 3 or so.. So, invest a lot of hours stringing up that coil, and a few hundred bucks in aluminum, and save $30/year...

Excellent economics there..

2321. small antennas

Newsgroup: rec.radio.amateur.antenna
Date: 2008-09-15 19:33:35 UTC
From: Art Unwin <ArthurUnwin@gmail.com>

Source record: 22295

I am begining to believe that there is really no interest in small
antennas
I see that many antenna labs use such things as their purpose in life
as well as more energy efficient antennas
but they are not producing anything. It also appears that they are
also not interested in spending any time on such research. If you go
to the Illinois University antenna lab they are all sitting with
computors expecting something of interest will pop out without them
putting any thing positive in in the first place. So is there really
somebody being hired to produce small antennas? Same situation with
hams as they fight at the very idea of the possibility of small
efficient antennas that like the Universities do not want to hear of
the possibilities
One doctorial student at Illinois University in Central illinois
stated that they have so many requests for review of antennas by the
populace it is not unusual to ignore the pleas of the local populace
presumably based on the premise that if it was possible they would
already have done it. They have teachers way more intelligent than
ordinary peopleand, where one spends most of her time working on
behalf of the IEEE that research or computer operation has to be put
to one side.
If there really was an interest in diverse antennas instead of
personal promotion maybe our tax dollars would be better spent. Yes,
I write off the University of Illinois as they have never produced
anything as pioneers in antennas especially with the departure of the
log periodic designer that they paid hansomly to hang out there
instead of there own Universities. So to sum up puting U of I to one
side, is there anybody in Industry who desires small antennas or
Universities investing time in such things ?.
When O when is anything going to happen in the small antenna areana or
is the need actually ficticious
because of diminishing returns with the use of such? What Universities
in the U.S. that are serious about small antennas and what have they
produced in the last couple of years? If they can't or deny the
possibilities then why fund them? It is your money. But then who
cares, we have antennas already so we don't need anymore
especiually when denial of the new suggests that all is known.

If you are looking for a University to compare with try Rhode Island
I don't believe any University can show antenna results in the past
few years that are better than those produced in any other state.
What has your State University done that is notable?

Let's just cut to the chase, the U of Illinois gave you the bum's rush. When all your writings read like Marx's manifesto instead of science, who would blame them? If there were universities on every block, and caped dons wandered the streets, you would still have only an empty tin cup sitting on the corner waiting for the first plunk of a nickel.

Hi all,

This again falls under the presumption folks are actually interested in antennas.

Perhaps it is only one step removed from Art's lamentations of being shown the door, but hopefully it isn't such a weepy heartbreaker.

Anywho.

It has been reported for several years now that researchers have been designing antennas to harvest power from transmission antennas (power lines in the quote above) for the purposes of powering home gadgets. A report in the New York Times offered an article how Apple was looking into a way to recharge their iProducts through the air. I've even mentioned the coupling mechanism inferentially in the past.

Art's tear swollen eyes are too fatigued for such reading, Bart probably prefaces all his google searches with the keyword xfiles, and no one else has noticed this either. (Bart should have prefaced with the keyword Tesla, but to be fair, it would only dump 1,000,000 nutzo links.)

The term-du-jour is evanescent waves (we call them near fields) and lab reports offer up to 60% power transfer. I've modeled some that are more efficient (low ohmic computer bits were used to optimize the transfer); but to truly model what has been put on the bench (literally and figuratively) would consume too many segments, and violate too many NEC prohibitions. Still and all, I've replicated their results conceptually where I could jimmy the scales.

While Art whines about the lack of science (surprising complaint, or perhaps I should say an ironic complaint), these constitute SMALL antennas that would fit into a matchbox if they were modeled on his claims (again, that hint of irony).

Those so interested may, of course, wire me for files.

When I was a kid (about 11 and making the "change over"), I hooked a neon oscillator to an rf-step-xfrmr with a full wave bridge "detector", to a VERY long wire antenna (very well insulated by egg insulators) and it would pulse (flash) the neon bulb every so often ... gave me big kick at the time ...

However, I don't think it would have powered a "fly-power-anything!" ... well, other than a single transistor "radio" which got its' power from the same ... but then, you probably built one from the plans which were around back then ...

Hmmm, just in case any "youngsters" are around and wish to duplicate
"the experiment", change "detector" to voltage-multiplier-circuit ... if
you need, google it.

In what area are you refering to when wanting a small antenna.

In the areas that I use antennas, that is, in, ham and cb, there are lots of big, medium and small antennas available.

If in the tv reception area there are also lots of choices, depending on the distance you are from a tv transmitter.

Where and what do you want and maybe someone will have an answer for you.

Lots of luck,

Well, there has always been the "Texas Bugcatcher" (and, Cecil owned one
of these, I can tell, he still has the coil laying around ;-)
<chuckle>), but the "bugs" always left a bad taste in my mouth -- to
some extent the DLM (google "Robert Vincent" and "Distributed Load
Monopole" for more information) improves upon that, and to a larger
degree than I expected!

However, some claim that is only "in my imagination." <satisfying-grin>

Hi Richard

Yes, I sure would like to see your EZNEC file. I'd benefit from seeing
how you modeled it too.
The antenna looks like it iis designed for satellite reception.
It interests me to consider that the "DCA" that I developed would
(perhaps) be a design concept applicable to this operational requirement.

Jerry KD6JDJ

"Art Unwin" wrote
> When O when is anything going to happen in the small antenna areana or
> is the need actually ficticious because of diminishing returns with the
> use of such?

Art, O please note that even an infinitely small isotropic radiator has a peak (and r.m.s.) intrinsic gain of 0 dBi in free space. A linear, 1/2-wave dipole has only 2.15 dB more peak gain than that for those conditions, due to the shape of its radiation pattern.

If you can prove, and others can replicate your claims that the radiation performance and efficiency of your shoebox antenna with equilibrium/ particle theory/ tilt etc compares favorably to an isotropic radiator or some other known and proven reference antenna, then your critics will disappear.

Technobabble and hand-waving do not count. Neither does scoffing at decades of field-proven research and practice in antenna engineering, while at the same time claiming that the "masters" support your concepts (even though your concepts are unproven).

Otherwise your posts about this will continue to be viewed with high skepticism and scorn, and rightly so.

Probably you will duck behind your "patent claim" now, as you have done in the past when pressed for details.

And so it goes (and goes, and goes).

RF

Uhh, those eznec files, they are kinda like a high-school\college friend recently explained to me in financial terms:

"If you have a sheet of paper claiming a "controlling interest in gold", all you REALLY have is a sheet of paper! If you are looking at the gold you are "invested" in, you REALLY HAVE the gold!" <wink>

But then, it is only when you realize there have been more "certificates in 'controlling' interests in gold" issued than the amount of gold which exists in the world, that, you suddenly awaken to a HARSH reality! (like some have "been had!")

Read about "The Great Depression", I tell 'ya, there are clues to be had there! I mean, really, it is the same old game, just new "marks!" <chuckle>

Right now, the Analog channels that I get solid and noise free seem to be subject to fades on their UHF DTV counterpart. Makes me wonder how it will goof up the market when I won't be able to go back to analog as a back-up when the DTV goes down.

Note that QRZ.com and http://www.kb0mga.net/exams/ has
tracking tests available on line for free as do a couple of
other sites. Probably the best of the license manuals are
those published by the ARRL. Not free but relatively
inexpensive. The ARRL books have good explanations of the
theory so that you don't have to rely on simple wrote
memory. Note that the questions on the above web sites are
the ACTUAL questions which are found on the tests although
the particular set you get is random.

Really? Something is quite wrong there!

Digital signals should require much less power to deliver the same
"quality" signal.

Indeed, digital is an upgrade to all existing systems. Listen to an
analog signal, then a digital signal--whether over hardwire (remember
the phone adds with the "dropping of a pin") or AM/SSB over RF ... can
you just imagine attempting an analog signal over a dial-up modem or
broadband? We would still be in the "internet stone-age!"

All that really does not take any thought at all ...

Hi Richard

That is an interesting antenna (AS-2815/SSR-1). I didnt know how to feed it, but I see how you did it.
If that *is* used to communicate with polar orbiting satellites, I'd expect the DCA to outperform it.
I have demonstrated fairly well that the DCA outperforms the Quad Helix for reception from NOAA polar orbiting satellites. I'd be curious to know what the Navy would think of the DCA for a replacement of that AS-2815/SSR-1.

Just how do we get more metal up in the air by making them smaller? And how do we do that so that it can go in your pocket with the portable without poking a hole in our pants? Up till now, the answer has been to put up with poor performance and put a base station (cell site) everywhere you can. The physics says you either have to put the antenna where there is signal, or you will have to put the signal where the antenna is. Even if you could get 10db gain in your pocket, how do you get signal there?

Right now, I suspect the real gains to be made are with minimizing matching losses. When you are talking short, the primary concern is to somehow minimize the losses in a matching network that actually contributes to the useful radiation pattern. We need some advances in transmission lines for minimal losses and convenience of use.

You need to be able to think practically to start with, unless your primary concern is marketing hype.

Hi Jerry,

Well, I got most of the structural details down OK. However, the feed
is by guess and by golly. In the pictures you can catch a hint of it
(especially when you compare to my file), but this does not say if
there is a phasing harness hidden inside the stanchion tube.

As for the Navy being interested in your DCA, I've been on the vendor
list for years, and worked with their RFPs the same time. It is not
for someone who isn't ready to seriously commit a lot of time to
paperwork.

As for the others following this about crossed antennas, helical
antennas, there is one model the Navy uses that has interesting design
(Art will probably claim it proves what ever flavor theory he is
selling today) the AS-2227/SRN-9:
http://www.combatindex.com/hardware/detail/sensor/nav/as-2227.html

JS-

Why do you say that?

You can't have a less-than perfect digital TV signal. There is no snow because a weak digital signal's picture freezes or goes away. Therefore there is no way to compare quality levels of less-than perfect pictures.

Most of the time my simple antenna picks up good HDTV. However there are times when reception is poor, and I have to switch to the Analog tuner. I'd rather have a little snow than no picture at all!

I reckon most are not although some may be. However, Seif is currently
an associate professor in New York University's Journalism Department
with a Masters in Math. He is nowhere near the caliber of a quantum
physicist which would render your point moot, would it not?

Hi Richard

You got good results from your "guess" at how to feed that Droop Cross Navy antenna. I'm impressed. The fact is - I wouldnt advise the Navy to change that antenna if it is functioning properly. It is simple and it is rugged looking.
As you know, I am not on the selling end of anything, including antennas. I do like to state that the DCA antenna design concept performs better for horizon to horizon coverage of polar orbiting satellites than any other omni azimuth antenna.

That theory does seem to explain some recent observations. However, it is still theory, not absolute fact as you seem to proclaim above ("THERE EXISTS A QUANTUM STRUCTURE about which not much is yet understood"). The structure may or may not exist. I have no problem with it since nothing says that all matter must be in the form of nuclei, protons that can be combined in an orderly manner to form something large enough that we can "see". In fact, it likely does not exist physically as "matter"; rather, the theory is simply a concept that explains some observations. Given that matter is 'anything that occupies space AND has mass" dark "matter" could be any entity (like energy, that is a known entity) that can be shown to have a mass equivalent and behaves like mass under certain conditions as photons do. Certainly we are a long way from saying that this is an ether or medium that supports the transmission of TEM waves.

You are probably correct if you are speaking about "small" antennas as they relate to HF.

No longer is there that much demand for shortwave bands to communicate with, as you well know. This is the information age and the relative bandwidth of HF is so small is to render HF useless, even for simple email if widespread usage were desired. There's not much money in it.

No money, no research.

Even if you had a shoebox 160m antenna that worked, your market would quickly reach saturation point. You might get an enthusiastic reception by the readers of CQ magazine or be honored by the folks at ARRL but not much more. Is that why you are trying to link your antenna "discoveries" to finding the holy grail of the Grand Unification Theory?

As a matter of fact, it would. From Webster's:
"moot - (1) open to discussion"

Here's what Charles Seife says under "Acknowledgments":
"A lot of people helped me write this book: it's not
possible for me to name them all. Over the past few
years I have interviewed dozens of physicists,
cosmologists, and astronomers who took the time to
explain the nuances of their work to a journalist.
I thank them for their enthusiasm and their patience.
They are the reason I wrote "Alpha and Omega" in the
first place." The Bibliography is pretty impressive.

But feel free to try to disprove the Casimir effect.

The amazing thing is that space cannot exist without
those particles which provide the very structure of
space itself. It seems that space is a property of
matter rather than vice versa.

Look at the spectra of the signals an compare the levels. More amplitude in the sync pulse and average video than the ATSC pilot across the board from what I'm seeing. Perhaps they are trying to get away with less. Perhaps fooling around with tower work and dropping the power. Hard to tell with the GUI meter and never had the service monitor up at the time. One is DTV VHF HI that is a new one with no Analog so I lose it completely and 2 are UHF that are fading on me from time to time where I have to punch to the Analog broadcast, one of which is VHF. Generally more power is needed on UHF to come up with comparable range.

Meaning it is arguable as to whether you point is in fact valid. I am merely trying to show, politely, that your one line assertion has little or no impact relative to the credibility of the preceding paragraphs in your post.

>

Not exactly an impressive bibliography but typical of something a journalist, not something a scientific researcher would write. Would a Phd candidate use Wikipedia as the bibliography in his thesis? Seife makes a great sience writer but he is not a quantum physicist not did he reference one in his "bibliography".

> I thank them for their enthusiasm and their patience.
> They are the reason I wrote "Alpha and Omega" in the
> first place." The Bibliography is pretty impressive.

As per my assertion above, nope. Not impressive. For someone writing a junior high school term paper, yes for a "C" grade. For a scientific paper, no. It is not even a true bibliography.

>
> But feel free to try to disprove the Casimir effect.

Why would I want to do that? I already agree that the vacuum of space fluctuates slightly around a zero point because, for example, EM fields in a volume at vacuum may average zero but the fields themselves fluctuate around their zero point causing quantum changes that in turn result in small fluctuations of vacuum.

This does nothing to advance any theory that an ether or media exists
for transmission of TEM waves. It only says that there is no such
thing as a perfectly stable, absolute vacuum when fields of any kind
are present, which they always are. Also your cause and effect seem
reversed; the existence of TEM fields (and static fields as well) may
have been shown to cause Casimir effects but Casimir effects have not
been shown not make it possible for TEM fields (waves) to propagate.

Easy, with digital you are simply determining whether a signal is present--or on (a binary one), on not--and off (a binary zero) ... an analog signal contains much more data which can "screw up."

>

Oh, yes you can, indeed, ever hear of "lossy data compaction?" It is used for audio and video where not every bit/byte of data need to be perfect--attempt that with an executable file and it fails ... the program itself can "deduce" if the data is just "degraded" or is beyond use and pass it along to the video/audio device or toss it as decided ...

> Most of the time my simple antenna picks up good HDTV. However there
> are times when reception is poor, and I have to switch to the Analog
> tuner. I'd rather have a little snow than no picture at all!

As I say, something is wrong, and it may not be "all on your end", and broadcast HDTV may need some upgrades to the software handling the coding/decoding of the signals ... widespread usage, in the future, and "fixes" along the way should provide a much improved system.

I have not had a chance to "experience" broadcast HDTV yet ... however, the cable HDTV is much improved over old analog ...

You must be assuming that the structure of exotic matter has been proven to form part of the structure of conventional space. OK, but that is a great logical leap from theory to fact. Your assertion is only true if exotic matter truly exists in conventional space. Maybe it does, maybe it doesn't. Actually, nothing of the sort has been proven. Far from it. All we know is that in astronomical observations, extremly large amounts of conventional matter seem to be affected by gravitational effects, positive or negative depending on theory, by some invisible entity that behaves as positive or even negative matter. For convenience sake, some physicists invented the term exotic or dark matter which may be nothing but a placeholder for some other entity that behaves like matter which advances their concept but which we do not understand yet. The observations in no way have confirmed that it IS matter.

Now, IF it doesn't exist, and I don't believe it does except in perhaps a virtual sense, then I am still fully inside each of the boundaries of the 4 accepted dimensions of this Universe.

Theoretical absolutes don't happen as often as in the space in the head. You can't convince me that gravity or magnetic fields really require a media to travel through. Assuming there is one would be a crutch. Didn't stop us from getting people to the moon and back.

Actually, I see no reason for HF to not be any-more-LESS usable than any
other RF Frequency. Digital voice has simply not been adopted because
of the expense in replacing all the analog equipment with digital
equipment ... something which is sure to be "fixed" in the future ...

Everything we see and hear are brought to us by waves.

If you have trouble with that, explain how polarizing light filters work with bullets (shooting photons), or how the different wavelengths of light can be "filtered" (or do you claim these filters are really "photon sorters? i.e. 'bullet sorters!'") LOL

Why in the h*ll would you bypass a theory which explained the frequencies of RF (the freqs BETWEEN audio and light) with a totally different theory?

I tell you, "Some minds BOGGLE the mind!" ROFLOL

Somehow, you would have to first scrape all present knowledge/theories
and "go back to square one."

As, all theories, even the big bang, count on all matter being "ripped"
from the fabric of space/time itself ... somehow, someway ...

And, while there is the "string theory", this theory still depends on
some type of "particles vibrating." And, the thrust of the whole
argument becomes whether it is the construction of matter itself from
these particles which define "matters properties", or it is "vibrations"
of these particles which define the property matter holds ...

Either way, you begin with some type of particle ... a type of particle
we cannot prove the existence of--yet.

I experience the same phenomenon. My antenna is a UHF indoor bow tie dipole. (All my HD channels are currently on UHF.) I am about 30 miles from the TV tower which is at 1200'. My HDTV set can show signal bars like a cell phone. Without moving the antenna or other surrounding objects, the signal will sometimes slowly vary by one or two bars. If it goes down too far the picture breaks up and quits. At other times the same station will give a solid 3 or 4 bars.This happens on all channels. Perhaps atmospheric movement? Lots of dust here in the desert. Any other ideas?

>I have not had a chance to "experience" broadcast HDTV yet ...
>however, the cable HDTV is much improved over old analog ...

I have cable HDTV on my other set in the family room. Surprisingly (to me) the broadcast HDTV picture is superior in quality to the cable HDTV picture. Perhaps Cox is using more compression to squeeze more channels in the line.

>
> Jerry KD6JDJ

Yes. Its nomenclature is AS-2815/SSR-1A. It was designed for the UHF satellite "Fleet Broadcast," 240 - 315 MHz, but I have seen it used only in a narrower range, more like 248 - 262 MHz. The pattern is semi-omni, essentially taking in a view of the entire sky.

The system is receive-only and has been a mainstay of fleet comms for decades. The version I grew up with had a 1200 bps digital mux of fifteen 74 baud TTY signals (100 WPM). It may have advanced since then; I don't know the capabilities of the -A version. (I hope they made it more idiot-proof.)

Ships are usually fitted with three or four antennas, strategically placed so that at least one of them is clear of blockage. The system uses what is called "pre-detection integration," whereby the strongest signal is demodulated, on the presumption that it's the best quality. It's a form of diversity reception.

The original AN/SSR-1 system downconverted the received signal to a 19.95 MHz first-IF out on deck, a few feet from the antenna. I believe the AN/SSR-1A amplifies the received signal and it goes all the way to the radio room at the d/l frequency. Maybe somebody will know for sure whether that's right, but I think so.

Yes, ducting and "ghosting" of the signal(s) due to reflections, etc.--I
can see these as being a REAL problem. From your description(s), sounds
like "they" just took the exact-same
technology/encoding/decoding-schemes and implemented them onto broadcast
... what works well with cable (a relatively "stable" signal NOT prone
to the effects stated above ...) may not work all that well with
broadcast ... sounds like some "upgrades" are already in order.

I have just assumed, up to this point, that the digital HDTV signal is
"packeted" ... however, unlike our broadband modems and satelite
internet, you cannot request for a corrupt packet to be "resent" to your
TV ... however, I am wondering if corrupt packets (or, seriously
degraded ones) are just being "tossed" rather than passed along to the
video/audio circuitry? Perhaps the software should assume that no
matter how degraded (or, at least seriously degraded packets) should be
passed on and the viewer be allowed to determine if it is of enough
worth, or not? It almost sounds like this would be preferable to
no-signal-at-all. But then your description of "the bars" beginning to
degrade would soon reach a point of "un-viewable signal" anyway?; so,
at this point, perhaps no-signal-at-all is preferable ... hmmm, I wonder?

Woo-hoo! I remember that beast! I had an interference study to do on it.

The SRN-9 and WRN-5 were used with the old Transit satnav system, a
precursor to GPS. It worked OK (usually) but the satellites were
sub-synchronous and you could only compute a fix during a pass, which
happened only a few times each day. Even then, you needed to get it during
rising Doppler, which really meant half a pass.

> 73, Mac N8TT

The DTV RF signal needs to be about 17 dB out of the noise to work and produce a nice, clean picture. Analog TV RF signal needs to be about 40 dB out of the noise for a snow-free picture on screen. Holy crap, that's 23 dB! Coincidence? I think not.

In my case, I get generally horrible analog performance from Los Angeles stations, 124 miles away. However, I usually have a half-dozen digital pictures from there and they are, of course, perfect whenever they come in.

By the way, the original question -- as if anybody really remembered it -- is answered here:

http://rabbitears.info/market.php

That site has a grunch of data. See the links at the top. This guy is working his butt off.

Actually, I should explain that, as my words just sound too callous. My mistake, just attempting to meet the discussion/post with all the considerations due them/it ...

It is hard to have respect for someone who uses google groups for longer than a couple/few weeks and then gripes about it ... there are still plenty of free news servers and a whole slew of news readers available to allow you freedom of choice in what and who you read.

If someone does not have the technical abilities to setup/use a decent news reader, how can you expect them capable of other technical abilities? At least, that question always pops up in my mind.

Well, there is, sorta. You do need much more analog signal to get a noise free picture, compared to the level of digital signal you need for a good "lock."

By the old TASO standards, you need over 40 dB s/n to get a nice picture, which requires a lot more peak RF power. By comparison, the digital signal needs only about 17 dB s/n.

I cannot call "that one" one way or another ... I cannot think of a model to even give me a clue ...

What is your take on that? Is there "a place of true nothing?" I mean, would the matter from our universe "go there?"; if by no other means, then by some "form of osmosis?" Or, is our expanding universe "going there?"

Like your assertion that transmission line currents are
common-mode, your assertion that Richard P. Feynman is
not a quantum physicist is equally valid.

> ... Casimir effects have not
> been shown not make it possible for TEM fields (waves) to propagate.

Your double-negative makes interpreting your statement
tricky. Most modern physicists believe that fields and
waves are made up of quantum particles of matter/energy.

The Casimir effect has been shown to expose a structure
for universal space through which EM particles propagate.
IMO, it is only a matter of time until cause and effect
is established. In the meanwhile, you could disprove
that cause and effect by proving that "TEM fields (waves)
can propagate outside of the universe in the complete
absence of a space structure.

OTOH, when the digital signal is neither a one nor a zero,
or the CRC doesn't check, it fails completely while the
analog signal is slowly fading away.

During Hurricane Ike, all the digital signals here failed
while the analog signals were still (noisily) providing
useful information.

I hear digital voice used on HF amateur radio has the
same problem.

Dear Sal:
Thank you. I should have taken the trouble to think about the
difference.
Thinking back to the extensive tests of (analog) TV performance that
were performed in the 50s, makes the 64 dBu understandable. At that time,
the noise-figures of TV sets were, by modern standards, poor. It was also
found - without surprise - that people would tolerate a poor picture is the
sound was OK, thus followed the preferred ratio of video to sound carrier.

As noise figures fell, many of us became accustomed to satisfactory
performance using simple, indoor antennas. That is another way of saying
that the ERP standards of the 50s were overkill in the 21st century. With
the advent of DTV, outside antennas will once again become the norm.

What seems to be missing - at least until competitive pressure catches
up - is an effective way to compare NF of TV sets or converter boxes. One
needs a box that presents a small-signal DTV signal.

Again, thanks. 73, Mac N8TT

We certainly traveled through the medium of space in
order to get to the moon. EM photons obviously travel
through the medium of space.

What you need to prove is that EM photons can travel
somewhere else besides the medium of space, i.e.
outside of the boundaries of the universe.

(P.S. Since "media" is the plural of "medium",
"a media" is improper.)

This is covered by the "Bubble" or "Multiverse" theory.
Between the bubbles, outside of any worm holes, there
exists absolute nothing. An expanding universe "displaces"
the absolute nothing. A particle, like a photon, cannot
"go there" because there is no medium, i.e. no structure.

Thank you all for replying. Sorry to take so long to get back here. I momentarily put the project aside because, after missing the first game, (I posted the first message about an hour before game time, lol), the Jets will be carried on my cable stations for the next two weeks. Add the bye week into that and I had a couple of weeks to get this thing together-there was no super-immediate rush. But I am going to build this in the next week or so.

As far as Channel 2 going to UHF in February, the Jets regular season ends in December, so an antenna that is useful until February will take of this season nicely. Any post season playoff games by the Jets, (should they get into the playoffs), will be broadcast nationally, so I won't need the antenna for that. I'll worry about next season when it happens. However, don't be surprised if next September you see a thread about building a UHF antenna for the new Channel 2 New York.

I have high hopes for this project giving me some kind of watchable, albeit possibly snowy signal. Here's why. Several years ago I dangled a piece of twin lead from my second floor window to the ground and got both the sound and an extremely, extremely snowy picture of Channel 4 New York, (which carried the Jets at that time). The house I lived in was a few miles farther inland than the one I lived in now, and it was just a simple 12 foot piece of twin lead out the window, but I got SOMETHING. Ths project will be on a pole, on a roof, on a house closer to the water using an antenna scientifically optimized for Channel 2, so I think the chances of getting something watchable are very good. There must be something more at play here than just "line-of-sight" from here to the Empire State Building, at least at this frequency. Besides, friends driving down to New York tell me that they pick up FM stations on their car radios about 20 miles down the road from here. FM frequencies are a little bit higher, (therefore more straight line), than Channel 2. Though the requirements for FM reception and TV reception are not the same, it still indicates that I am not too far out of range for this frequency.

I have found an interesting project from the US Patent Office, so it is between that and Sal's Yagi. I am leaning toward the Yagi, so I will be back with more questions in the next day or two. Just a few questions:

A) What is the gain of Sal's Yagi compared to a single dipole?

B) In sound, there is a rule for Sound Pressure Level which says "double the distance, 6 dB down in decibels". In other words, If I

have a Sound Pressure Level of 100 dB at ten feet, if I move back to
twenty feet my SPL goes down to 94 decibels. Does a similar rule
apply to antenna reception, that if get good reception with a certain
antenna from 50 miles away, I need an antenna 6 dB more sensitive to
get similar reception from 100 miles away?

Since this is a ham radio antenna news group, I suggest that you look up
6 meter beam antennas. The 6 meter ham band is just below the US channel
2, so they would work fine for reception.

TV signals are horizontaly polarized, so make sure to orient
your antenna appropriately.

Since you are using it for recpetion only, no complicated matching
network is needed between the antenna and the feed line. 300 Ohm twinlead,
or a simple 300 Ohm to coax transformer will do nicely.

Geoff.

Cecil Moore wrote:

> ...
> I hear digital voice used on HF amateur radio has the
> same problem.

Amateur digital communications have one real and serious problem, they have not adopted Ogg Vorbis as their standard digital encryption/coding/decoding/error-checking "mode"--indeed, an actual "superset" of Ogg Vorbis is needed for radio duplex communications ... amateurs, in general, need be the "final designers"--that won't happen until larger numbers are involved.

Ogg Vorbis is open source, free to use/implement in your own software, it just doesn't get the blessing of the arrl and it can't be used as an excuse to inflate prices ... :-(

Until that is established as a standard, Ogg Vorbis, (or, a "mode" invented/designed/implemented with the same redundancy/efficiency/fool-proof-ness), these problems will be of a notable nature ... :-(How and when to request re-sending of error packets, how many times these requests can be allowed, how long to hold a packet in the buffers, how large of buffers to be used, size of the packets allowed, etc., etc., etc will all need to be agreed upon in that standard--so far NONE I HAVE SEEN ARE ADEQUATE--indeed, only one is on the right track at all ... and, the standard can be designed to be highly adaptable/upgradeable--with only firmware upgrades needed to bring old hardware completely up-to-date (manufacturers will surely attempt to get in control of this and be able to force the purchase of new equip/planned-obsolescence by the denial of new "flash firmwares" or designing new firmware upgrades in such a manner as make existing equip unable to accept them, example, just make it too large for the present memory(s) size(s) and disallow memory upgrades--you know, the "standard stuff" already being done. <grin>)

While you and a buddy can use it between yourselves, or, you can attempt to get your club interested ... it remains on the fringes ... I find "digital hams" on the HF bands to be as rare as "chickens teeth", at least ones working with decent digital transmission software/algorithms/etc. ... :-(

There was a group of hams which broke away from all this are were going to release open source code which would have to be accepted just because of its' sheer efficiency and performance ... internal bickering and outside pressures had/has brought its' progress to a crawl/halt at the present time ... such "tinker-ings" gets the attention of high powers in

high places ... :-(

(or, is this all just my paranoia--I will allow you and the future to decide ...) digital radio is coming ... it is just walking with a cane! LOL

Regards,
JS

I consider it a real shame that equilibrium is not a part of
examinations since equilibrium
is a basic in the electrical circuit of all antennas No where do I see
antennas explained other than the showing of capacitive coupling to
ground of antennas as a perceived circuit of an antenna?. Until this
is corrected we will never have continium of discussion between hams
on antennas.It is not a mystery anymore so why do the ARRL avoid it
like a plague?

Art:
You have written 2,947 posts to RRAA, and at least 2/3 of them
contain a reference to " equilibrium". Numerous people have asked
you to define or at least explain your usage of the term. So far, you
have not done so.Actually, you have either diverted the question, or
told questioners to do their own research. Your posts show that you
know nothing about how antennas work, and suspect very little.Why
would ARRL correct something that's perfectly fine as is???

Line of sight is the conservative and baseline propagation mode. You can more or less rely on that when the terrain is flat. There are Mathematical models that are somewhat predictive. Variations in elevation play a great part and living closer to water usually means you are lower in elevation. When there are variations in elevation, things that reflect and things that block the signal add to the complexity and the calculations usually go out the window. Area knowledge of the various sites and their odd coverage areas might more resemble an inkblot test. You may find an online coverage map for Empire State Building as it is a major radio and TV site. This might give you an idea:
http://www.tvfool.com/

For the VHF channels, weather also plays a great part. Thermal inversions that result in a cold/warm layer of air can act as a reflector, often doubling the range. I routinely talk to people 100+ miles away this way in the Summer months, but by Winter, the path is gone and can't even hear them anymore. You may have an advantage if your path goes over the water, otherwise it will hurt to be lower in elevation.

You might want to look at the IEEE Transactions on Antennas and Propagation. Most issues are full of articles on new ideas on how to design and model small antennas that can be effectively crammed into a cell phone or PDA. Same with antennas that fit in missiles, inside UAV's, and other tight locations. It's not a trivial exercise as smart phones may soon have many more radios inside (Cellular, Wi-fi, cellular data, Bluegoof, AM/FM/TV/Mobile-HDTV, 915MHz for TV remote control), and WiMax).

Unless I missed something, your rants seem to lack any specifics, URL's, references, examples, substantiation, and most obvious, are lacking in numbers. If you want to enhance your credibility, I suggest you do some reading and searching, before manufacturing yet another wasted rant and denunciation.

The neat thing about going full digital? You no longer have any idea why the signal breaks up. PERIOD. The Customer is no longer bothered by interference of any kind. Either it works or not. If your QSO, Phone Call, Mayday, Police call for backup, TV signal gets knocked off the air, you won't have a clue why.

I have experimented with Easy Pal Digi SSTV and DRM it is neat but I can rarely get the S/N high enough for a complete transfer. Text is more reliable, but it is hard for me to put my faith in a signal that sounds clean and strong to my ear but with no result. I could have passed several photos on MMSSTV with half the S/N and knew well what they were. Sometimes getting the information through is more important than waiting for conditions to get better to get it perfect.

I don't mind being a network admin. but being a radio op isn't quite dead yet.

Amplitude Modulation of NTSC requires a LOT of signal to be noise free since even a small amount of noise is visible.

We have no basis for comparison with ATSC other than by level, since we don't have a way to discern between multipath, power line noise, deliberate or any other kind of interference. How are we supposed to point the antenna? With a stupid meter that takes 10 seconds to average? All I can think of is to put it on a rotor and nudge it 2 degrees every 10 seconds until the picture pops in. It is amazing what gets left out in the rush to market.

Actually, NOT. Even the simple bars on a cell phone tell you if communication is possible or not. The software running on an up-to-date rig can describe the exact reason to you, if your rig interfaces to your computer screen ... not to mention broadcast HDTV is in its' infancy, taking its' first baby-steps ... even if you give the avg. American TV viewer this information, do you think he would know what to do about it? For "those dummies" you will pretty much have to have the software handle the problems ... or make simple recommendations, perhaps "MOVE THE ANTENNA DUMMY", or "RAISE THE ANTENNA DUMMY", or "BUY A DECENT EXTERNAL ANTENNA DUMMY", or "POSSIBLE SIGNAL REFLECTIONS ARE OCCURING, MOVE/REPOSITION THE ANTENNA DUMMY", etc. ROFLOL!

If the binary signal just clears the noise floor, and not by much mind you (I am hesitant to quote an exact figure here) a perfect signal is quite possible ... that is simply the nature of digital.

I just don't know why anyone would claim that digital signals are not MUCH superior to analog -- remember the old analog cell phones -- who would ever wish to "go-back-there???" ... the only software I have used with HF/VHF/UHF digital processing is open source ... I immediately made modifications to the decoding/coding scheme (Ogg Vorbis), "packet hold time" and size of the buffers and implemented my own CRC checking (faster algorithm) ... however, others must get a copy of it from me and we both share it or no communications are possible. I see amateur software in the same light I see amateur antennas -- build your own or have another amateur elmer/tutor/instruct/assist/share-with-you ... it is just traditional and the true spirit of amateur radio ...

> I don't mind being a network admin. but being a radio op isn't quite dead
> yet.

I actually worked at the college I attended in the 1990's when I
returned to go "full into computers" (my previous degree was as in
electronic engineering), and before I began an intern position in my
field of study. My last few months, before receiving my diploma, the
actually created a new position for me, "Student Programmer", I was
actually quite proud of it--even though the "big boys" seen it as a
joke! LOL Being both a programmer and a network admin. assistant made
the job seem like "money for nothing", what other sys admins seen as
major problems and were on the phone to Digital Equipment Corp. (DEC)
over, for the VAX, I usually had fixed by the time the techs got there
... made me rather "hated", really ... however, most finally came around
and asked for the perl-scripts and C programs I used to automate every
task I could find! ... common computer users worshiped us ... "some of
us" let this go to their heads ...

>>> picture breaks up and quits. At other times the same station will give a
>>> solid 3 or 4 bars.This happens on all channels. Perhaps atmospheric
>>> movement? Lots of dust here in the desert. Any other ideas?
>>>

As I have said, I am anxious for it to be deployed in my area ... I am
already looking into "digital to analog conversion boxes" which I can
download the firmware from to "reverse engineer" and then flash open
source firmware into ... either by hook or by crook. <grin>

Only God can control atmospheric conditions (but then, there is HARRP
and other such projects which do SEEM to alter them), and who can stop
that neighbor from erecting that steel storage shed, building that
wrought iron fence, installing those bars on his windows, operating that
ham rig from his stealth antenna <grin>, etc? :-(

Mike
I know more about antennas and radiation than you think !
For instance, equilibrium demands that charges do not move laterally
along an antenna when in equilibrium
Without equilibrium charges do move along the surface of a radiator
and Newtons law of parity demands
that charges are moving thru the CENTER of the radiator thus
encoundering just copper losses.
Thus for a radiator that is not in equilibrium has three resistance
1 Radiation resistance
2 outer resistance
3 Inner copper resistance.

Equilibrium is nothing more than the enforcement of Newtons law of
parity.
This is so simple to those who work from first principles for
themselves instead of being lemmings.
Correctness is not always determined from a poll
Regards
Art

I am not a servant of this newsgroup. All I am doing is trying to
educate those that are willing do be educated
with respect to antennas. You for your self can read the history of
the masters and Newton to determine how they were aware of the weak
force,
its angle and size and yet cannot describe it. Even so it is included
in all calculations involved in the Universe because equilibrium is a
staple.
The fact that members of this group need to be shown that the weak
force is not fictitious is pityful . I have in the prior posting
descibed the action of radiation where previously I have stated that
the weak force is the rotary current flow which as well as the rest of
the details given are preordained by Newtons law. Prove Newton is
wrong and you have my attention.
Nothing personal

People used to think that matter can neither be created nor destroyed.
E=MC^2 took care of that. By equilibrium, are you referring to the law of
conservation of energy?

If I choose not to expend the time and effort, then it is a matter of posting or not posting when choosing the web interface. Sure there are plenty of free news servers and no need to use a free news reader since outlook express works fine, John. I will not go to throuble of locating a free news server just to plonk you. But I will do it from the web interface if at all possible.

I believe that! I keep on pushing the facts and as yet nobody has
shown that they are in error
So n ow count the number of posts that I have seen in return and
measure their content with
respect to the indicated facts.
My target is to over ride the reluctance to change on this subject
before I die
Why not start a revolution and analyse the postings of this thread and
show
where they differ from those of mine. Be the first person to do so
presuming
that you graduated from high school. I had to memorize and fully
understand Newtons laws
before I left high school and I am presuming the same happens here in
the U.S. of A

As far as whether I am truthfull or not I would remind you that a
$5000 bet was proferred that I could produce the antenna that I talk
about.
The person with that bet was willing to place the money in advance for
holding. Nobody took him up on that bet or mine as I wanted to be a
part of it.

John, Quiz Question: Suppose you tried to modulate a 14 Khz carrier
with a 50MHz digital signal. Would that be possible? (Y/N) Where would
you locate the side bands? (________ and ________)

This is not relevant to the orginal discussion. The discussion was
about what you said was the structure of space and which I said may or
may not be the structure of space. You changed the topic to address
the question of one's existence inside or outside of said structure.
This of course is a bizzare notion since the existence of a locus in
which someone or some thing can exist outside the bounds of our
Universe has not been proven or even proposed in non-fiction science.

No, the AM Broadcast Band is the MW band, ~.5Mc to ~1.800Mc ... not related to happenings in the 40m amateur band at all ...

Why must there be an "it" through which TEM waves proagate? Why cannot
they propagate through nothingness? Not all volumes of space are
necessarily occupied by any form of matter.

Really? I am afraid no one can possibly agree with that most-bizarre
statement ... unless space is occupied by the "matter of space", it
ain't space.

Remember these steps:

1) Engage brain.

2) Open mouth. (or, place fingers on keyboard)

3) Make intelligent sounds. (or, type meaningful sentences)

4) Repeat as necessary ...

ROFLOL!!! Brother, my wife and I just love your slap-stick-humor!
Makes me miss the Three Stooges ...

I think your term for equilibrium is the term the exams use for
"resonant". An antenna with "equilibrium" is your name for an antenna
upon which a TEM standing wave is present with a standing wave ratio
of 1:1, correct? That would be your point of maximum effciency of
ejection of galactic particles from the end points of the antenna
which is optimized by sloping it relative to to the earth plane.

We are talking ab out radiation not the eather.

The law I am referring to is every action has an opposite reaction.
It is a very short law that has not been disproven.
Application of that law states that for a radiator not in equilibrium
a charge is moving on the outside of the radiator THEREFORE
there is a charge moving in the centre of the radiator in the opposite
direction.
So simple Why do hams reject it? No, the charge at the centre is not
and cannot radiate

Mike
I know more about antennas and radiation than you think !
For instance, equilibrium demands that charges do not move laterally
along an antenna when in equilibrium
Without equilibrium charges do move along the surface of a radiator
and Newtons law of parity demands
that charges are moving thru the CENTER of the radiator thus
encoundering just copper losses.
Thus for a radiator that is not in equilibrium has three resistance
1 Radiation resistance
2 outer resistance
3 Inner copper resistance.

Equilibrium is nothing more than the enforcement of Newtons law of
parity.
This is so simple to those who work from first principles for
themselves instead of being lemmings.
Correctness is not always determined from a poll

Regards
Art

-

I've heard of Newton's laws of motion, but not Newton's law of parity.
Newton dealt primarily with motion, mass, and such. Electromagnetic
radiation hadn't even been discovered when Newton was alive.
Electromagnetic radiation does not behave the same way as matter, which is
described in terms such as momentum, inertia, accceleration and such.

Some months ago, I made this exact mistake, made, almost, that
exact-same statement.

Although I did not leave with a complete and clear understanding of
"Arts' Equilibrium", I did leave with an understanding it was NOT
resonance ... so ???

Regards,
JS

First off, I did not intend to have my post interpretd as a sneer. I'm
sorry if you took it that way. I said, "Oh yeah!" because I thought of the
point after I submitted a previous post.

The equal and opposite reaction law only applies when there is mass.
Electromagnetic radiation has no mass. Therefore, the law does not apply.

Yanno'? This is all closely related to the "Personal Attack Ploy."
(also, known by other names)

However, this one goes, "I will think up an extremely complex trick question from my gorgeously, exquisitely, intellectual mind. I will then trip up the "mark" with my beautiful complex and deep plan, and use this error on "subject A" to prove his statement on past "subject B" is wrong, by sheer implication ... " I see this used on Cecil OFTEN, and by the same ignoramuses a LOT ... I often wonder, "Is anyone here aware enough to wonder if I see this or not? If others here notice, or not?" ROFLOL!

Most of us tried this in grade/high-school, did not find we got the results we expected, abandoned it, and moved on ...

You may wish to consider the same, or not ... however, I do see, with the "resources" available here, this childish ploy is VERY much alive and well! And, I have noticed it is accepted as being effective, by those ignorant to what it really reflects ... like the petty workings of their small minds!

Somehow, this all reminds of a gathering of old men at a botchiball court!, "elmering" a new "Botchiball Recruit." <scratches-head>

hi

maybe i am having a bad google day, can't seem to locate any
amateur usa, verticle antennas for this band

anyone know of any places that might be selling them?

i need a omnidirectional plan ol' verticle antenna for around
local repeaters

thanks

My engineering training is many years old now, but I haven't seen
equilibrium in the context of antennas discussed anywhere except by you, in
this newsgroup. Do you have any references to papers that have been peer
reviewed and published?

Thank you
I am very pleased that you adressed the subject directly and you are
quite correct

resonace can be but not necessarily equate to equilibrium.
Don't go away JS help these people out when you can. I they do not
stay on subject there is no need for me to respond

Well, I got that part "right" too (I think), as demonstrated by a 5/8 wave antenna, etc., they are NOT resonate but exist in the "confines" of your equilibrium ... but Art, they will have to take their lessons from "The Master", you! <wink>

Radiation has no mass? You just made that up

-

No, actually, a little fella named Albert Einstein made it up. An electron
and a positron have mass. When they come together and annihilate, they turn
into pure energy (two 511 KeV photons travelling in opposite directions if I
remember right), which has no mass. That's what E=MC^2 predicted; and
that's what happens in certain radioactive decays all the time. Positrons

get produced by the deceleration of neutrons which come too close to the nucleus of an atom with large mass. They then annihilate when coming close to an electron. This is just one example.

Radiation has no mass and is, therefore, not subject to Newton's laws. A link to a simple explanation at a physics department of a university is:

http://www.uwsp.edu/geo/faculty/ritter/geog101/textbook/energy/nature_of_electromagnetic_radiation.html

From that site (and also what I learned in college physics) is: ". . . a bundle of energy called a "photon" is released. However, particles of light differ from particles of matter: they have no mass, occupy no space, and travel at the speed of light. . ."

Oh I suppose a search on google re antennas and equilibrium will get
you something to read
but difficult if you are starting from Zero. The point where you begin
is Newtons laws, if they are in error then so am I
I doubt if you will find anything that definitely proves that he is
wrong.If a professor does not know what I have stated he should be
nfired
which goes for some of the people at University of Illinois in the
electrical engineering area.
EVERYTHING in science revolves around equilibrium. If a posting denys
that or does not respond to that Law
i will not respond and that includes Richard whose sole aim in life if
to divert the crowd with off topic nothings as he does not ahve any
engineering degree from any accredited college and thus is a pretender
looking for a date with any poster.

Actually, we only wish things were/are that simplistic. There is then "the other story" (hey, did I just see Paul Harvey in here?)

http://en.wikipedia.org/wiki/Mass-energy_equivalence

Time and movement are very much in play, as are "kinetic energy factors" ... in a nutshell, mass to energy is much "easier" process than energy to mass -- and, certainly, much easier to compute/define/determine.

Newtons laws are not in error. But your application of them is in error.
You are applying laws that apply to objects with mass to electromagnetic
radiation, which has no mass.

>engineering degree from any accredited college and thus is a pretender
>looking for a date with any poster.

I have an Engineering Physics degree from a university program that is an
ABET certified engineering program.

Photons have zero rest mass. Otherwise, they couldn't travel
at the speed of light. But photons traveling at the speed
of light certainly have mass. Where in the world did you
get such irrational ideas?

> I have an Engineering Physics degree from a university program that is

After your latest posting, they may de-certify your university's
program. Exactly what university was it that taught you that
photons traveling at the speed of light have zero mass?

Hmmm ... actually, how can anything "really" be without "mass", isn't energy just a "form of mass" and "vice versa?" I mean, the equations certainly imply this ...

I mean really, when we deal with particles the size of photons and below ... aren't they "melding" into the same "thingys" <grin> ... and, perhaps my data is old ... I don't think "newton does quantum", but he might have a brother by the same name ... ;-)

Google fails to find anything under Newton's Law of Parity.
Which one of these is what you're talking about?
<http://en.wikipedia.org/wiki/Parity>
<http://en.wikipedia.org/wiki/List_of_physics_topics_M-Q#P>
<http://neohumanism.org/p/pa/parity.html>

>Equilibrium is nothing more than the enforcement of Newtons law of
>parity.

It's hard to enforce a law that doesn't exist.

Drivel: I tried to write a spoof of your postings mimicking your
style of technical word salad. I built the necessary framework, and
added copious amounts of buzzwords and technobabble. However, the
result was unimpressive and not even close to the quality of your
pseudo technological rants. I'm truly impressed at your ability to
fabricate such rubbish and would greatly appreciate some clues as to
how it is done.

Hint: Numbers, formulas, references, URL's, and specifics. Lacking
those, you would be a philosopher.

Incidentally, equilibrium is implied in the various FCC exams. If you
lack sufficient equilibrium to take the exams due to intoxication, the
FCC (or VE) will refuse to administer the exam.

So, look on the bright-side! Once you have proven Art wrong, you have
really done nothing at all!

We will still be stuck with the same mysteries, the same enigmas, the
same riddles! :-) Life would be NOT if not for the "unknowns" ... the
advances we can make, the riddles we can solve, etc. ...

Indeed, when I "run" a program to compute an area of a circle, the
volume of that sphere, the surface area of that sphere--it works! No
"error factor", no "pruning", no "adjustments", etc. Same with a
square, a rectangle, a cube, or for that matter, any polygon, be it 2d
or 3d ...

When I run "antenna equations/formulas", I get no joy. When our
"antenna formulas" approach to, around, 99.9999999999% of that

exactness, preciseness, we will be able to claim, "We are close!" ROFLOL

Until then, we will use the "Compute, then cut-and-prune-and-adjust method(s.) :-(

But hey, if there where not such questions, inaccuracies and "sloppy-ness", life would be boring -- now, wouldn't it? <another-straight-faced-look>

Unfortunately, you're correct. I have considerable experience dealing with various path impairment issues using various wireless technologies, especially Wi-Fi. User will complain that they loose connectivity, drop connections, suffer from erratic performance, and generally see performance well below what would normally be expected. The sources are many and varied. They're also very difficult to identify. Quite a bit can be deduced with simple diagnostics (i.e. ping stability, MAC layer packet loss, retransmissions) and from determining the pattern (does it always die during meal times), but in general, it's way beyond the capabilities of Joe Sixpack. I expect much of the same with digital TV.

However, I'm not worried much about the RF issues. It will either work or the customer can get cable or satellite TV. What I'm worried about are all the added cables and incompatible technologies found on the back of the HDTV sets and boxes. Another tangle of wires to deal with.

Anyway, radio is magic. Maybe I should get one of those Halloween pointed sorcerers hats with the stars and crescents.

Maybe you know of a secret diagnostic menu for my DTX9900?
If I remember correctly, all they know is RSSI and data errors. Please,
tell me if there are other indications that discern multipath, interference,
or any other reception problem without either sophisticated test equipment
or an analog indication - perhaps a color coded bar graph or channel
spectra that can react faster than the stream filling the buffer. I don't
know how ATSC handles error correction, but being a broadcast stream, I
would suppose only forward error correction is possible.

> If the binary signal just clears the noise floor, and not by much mind
> you (I am hesitant to quote an exact figure here) a perfect signal is
> quite possible ... that is simply the nature of digital.

PACTOR yes, but I don't see that with DRM or ATSC at all. How is it that an
s9 signal isn't enough? I'm truly glad to have SSB so I can tell the other
station to resend the file again. The Universe isn't digital. Certainly
not radio. The signal, no matter what modulation scheme you use to improve
recovery of usable clipped and buffered data, is still in the realm of the
analog during transmission over the air. Ok, you might not understand that
if you are only the network guy and all your traffic worries start at the
protocol level as long as the Fiber box is energized.

don't know why anyone would claim that digital signals are not
> MUCH superior to analog -- remember the old analog cell phones -- who
> would ever wish to "go-back-there???"

Actually the best sounding mobile phone I ever had was my full-duplex 450 Motrac linked to a mountain top site with wide area direct dialing. No one ever suspected I was mobile. But that was because my Analog link was better than a voice grade phone line. Digital is great if you can find the bandwidth, but great sacrifices and compromises have often been made in audio quality for the sake of keeping the occupied bandwidth of the RF channel within limits. What I am seeing on DTV, are stations that are doing one 1080i or 720p stream on one RF channel with maybe 2 more streams of 480i (often annoyingly compressed) OR up to 6 - 480i streams not so heavily compressed. So I hate to disappoint you, that not all channels will be better than analog until they find a way to do better than MPEG compression and conversion from an NTSC source.

The move to digital cellular allowed channel re-use without having the customer hear interference from co-channel sites so that many sites could be used to communicate with many small handsets. Do you think that will be much of an issue on Ham radio? Ham radio's greatest protection is in the fact that it isn't supposed to compete with other services. No privacy is needed or allowed either. If you copy the consumer model, you have no amateur radio anymore. So I ask you sir, wouldn't you rather be using a digital cell phone and leave the ham bands alone? Experimentation will continue and things will be learned, people will contest and rag chew and chase DX, but when ham radio for free is simple enough to compete with cell phone services or a twisted pair, there will be a problem.

We know that we can accelerate an electron to 90% of the speed of
light - it happens every femtosecond in one of any 100 billion crt
displays still glowing in the world. Some of us know its mass at this
speed. A question for the Newtonian philosopherz:
"What is the mass of a photon traveling at 90% of the speed of
light?"

Yep, only buy wireless routers/switches here which allow connection to
"off board" antennas ... (i.e., external antennas)

IMHO, and humble experience, reflections only worsen with a raise in
frequency ... others mileage may vary ... and EVERYTHING you own, which
is metal/conductive, is a wavelength+ at Ghz!

Well you may have hit on it. I am an englishman still in the learning
of American.
I saw the term parity as being on a par,maybe that is where I am going
wrong.
The law I am refering to is that every action has an opposite
reaction, not quite the words Newtons
used but the reaction is on par with the initial action. If you are in
doubt look up Newtons actual words.
Parity is what I picked up on this newsgroup so when in Rome........
Parity means the maintainance of balance
still sounds O.K. but I will not use it any more!

Truth is stranger than fiction and what I am saying is the truth or
factual.
In all the years that I have been on this group nobody has proved me
wrong
with respect to radiation. If they had I would have apologized for the
record.
For myself I can run all of these people out of town on antennas as
they are all self perceived experts
bestowing glory on them selves in retirement to supply the recognition
they feel they earned in the past.
Find an expert for yourself and ask him the same questions that you
ask of me.
My statements are nothing special and nor am I

According to Einstein, anything with energy has mass equivalence -
especially photons. But other than that, nothing with mass can travel
at the speed of light. You can have one, or the other, not both.

Ah, yes!

No Newtonians in this crowd. Perhaps it was the relativistic term
"speed of light" that confused this group so much. Let's restate it
in units that Newton could have appreciated.

We know that we can accelerate an electron to 167,770 miles/s - it
happens every femtosecond in one of any 100 billion crt
displays still glowing in the world. Some of us know its mass at this
speed. A question for the Newtonian philosopherz:

Most, if not all, you have stated is really quite unnecessary, or
certainly should be, to a REAL amateur ... think about it, what error
correction have you ever had with your analog equipment. What error
messages did your Drake ever give you, your Hallicrafters, your Gonset,
your Johnson (no pun intended on your "natural gear", lol!), etc., etc.
... however, count on MUCH MORE from digital equipment!

Wow, the brass pounders would just love you ... let me see, you remind
me of "Art Bell -- Stuck In Times" ... hmmm, that is the title of that
book, isn't it? ROFLOL

Your arguments suck ... you jam technical details into matters where
your eyes would serve as proof enough ... are you taking your meds? Are
you doing so on schedule?

MP3, MPEG, etc., etc. provides a MINOR increase in preformance (well,
not really, but it is a not a point worth arguing, consider this a "bone
tossing") at the cost of paying patent holders -- believe me,
audio/video is SO SLOW Ogg Vorbis is much more than "TOO QUICK" for
available systems/processors ... <sad-sad-pitiful-look>

Yanno', as a teenager, I would only wear Levis, it is called "Brand Name
Addiction" ... I am a recovered addict ... I can't claim a twelve-step
program for my recovery, but hey ... LOL

Comparing analog to digital is almost an exact example to some idiot
attempting the comparison of a stone knife (obsidian actually) to a
LASER Scalpel ... I just don't know how to state that with more force
and certainty ... perhaps someone will get through to you at some future
date ... all you look like to me is an ignoramus with little knowledge
... and living in "yesterday" -- sad really, very sad ...

If you ever awaken from that "tomb of stupidness" you are entombed in, I
bet you will be one embarrassed guy!

I'd say, you are just a "Stupid Brass Pounder" and an "arrl wannabe" ...
but then, I am guessing--I have no real psychic abilities ... ROFLOL, AGAIN!

Thanks for the laughs ...

Regards,
JS

> > #http://www.LearnByDestroying.com   AE6KS

I think I have to take a bash at the term equilibrium since it apears
to be latin this side of the pond.
Equilibrium means balance using a minimumn of words. If there was not
balance then there would be movement.
Scientists revert to an arbitrary field where the outside forces equal
the inside forces as in Gauss's law of statics.
If movement is to be considered then the field will be termed dynamic.
Adding a time varying field and radiators to the static field
it is then the same format as Maxwells laws ie. derivative mathematics
of one is exactly the same as the other i.e. they are the same thing

If you look at a sinosoidal curve you have balance between the stating
point and another point that is repeatable.
With a pendulum it is two swings ,forward and backwards which is then
repeatable. In the case of a radiator the length of one point to a
similar point
that is repeatable is a point of equilibrium. True the curve crosses
zero at the half way point but the areas enclosed either side of the
half way point
are not in repeatable terms unless the curve does not cross the zero
point that is resonant but not in equilibrium. When it gets to the
point of repeatebility
or at the end of a period a term used in frequency then that point is
both in equilibrium and resonant.
As an aside when changing from a static field to a dynamic field the
term equilibrium still holds which leads to the term
A radiator can be any shape, form or elevation as long as it is in
equilibrium. This rules out the idea that a radiator must be straight
and planar.
I think I have said to much Nuf said class dismissed.
Art Unwin KB9MZ....xg
So guys look at the intent of what I am saying without crusifying the
terminology.

Yanno', when I run that "equation" backwards, and then again forwards, I have a real hard time telling the difference ... you suppose it is just our "perceptions" which create the difference(s)? LOL

Indeed, this may be a plausible avenue to explore ... in that, our radio signals are neither photons nor waves ... well, at least during their "complete journey." Perhaps they "wink into mass" and then "wink into energy", we are just too slow to notice the changes! LOL

Remember, there are/is those exceptions where the, final, truth may be stranger than fiction ...

Regards,
JS

Thank you all for replying. Sorry to take so long to get back here.
I momentarily put the project aside because, after missing the first
game, (I posted the first message about an hour before game time,
lol), the Jets will be carried on my cable stations for the next two
weeks. Add the bye week into that and I had a couple of weeks to get
this thing together-there was no super-immediate rush. But I am going
to build this in the next week or so.

As far as Channel 2 going to UHF in February, the Jets regular season
ends in December, so an antenna that is useful until February will
take of this season nicely. Any post season playoff games by the
Jets, (should they get into the playoffs), will be broadcast
nationally, so I won't need the antenna for that. I'll worry about
next season when it happens. However, don't be surprised if next
September you see a thread about building a UHF antenna for the new
Channel 2 New York.

I have high hopes for this project giving me some kind of watchable,
albeit possibly snowy signal. Here's why. Several years ago I
dangled a piece of twin lead from my second floor window to the ground
and got both the sound and an extremely, extremely snowy picture of
Channel 4 New York, (which carried the Jets at that time). The house
I lived in was a few miles farther inland than the one I lived in now,
and it was just a simple 12 foot piece of twin lead out the window,
but I got SOMETHING. Ths project will be on a pole, on a roof, on a
house closer to the water using an antenna scientifically optimized
for Channel 2, so I think the chances of getting something watchable
are very good. There must be something more at play here than just
"line-of-sight" from here to the Empire State Building, at least at
this frequency. Besides, friends driving down to New York tell me
that they pick up FM stations on their car radios about 20 miles down
the road from here. FM frequencies are a little bit higher,
(therefore more straight line), than Channel 2. Though the
requirements for FM reception and TV reception are not the same, it
still indicates that I am not too far out of range for this
frequency.

I have found an interesting project from the US Patent Office, so it
is between that and Sal's Yagi. I am leaning toward the Yagi, so I
will be back with more questions in the next day or two. Just a few
questions:

A) What is the gain of Sal's Yagi compared to a single dipole?

SAL ADDS: YOU'LL GET GAIN OF SIX TO EIGHT DB (NOT SHOUTING. USING CAPS TO OFFSET, SINCE THE STUPID PROGRAM DIDN'T MAKE THE RIGHT MARKS.)

B) In sound, there is a rule for Sound Pressure Level which says "double the distance, 6 dB down in decibels". In other words, If I have a Sound Pressure Level of 100 dB at ten feet, if I move back to twenty feet my SPL goes down to 94 decibels. Does a similar rule apply to antenna reception, that if get good reception with a certain antenna from 50 miles away, I need an antenna 6 dB more sensitive to get similar reception from 100 miles away?

IT'S WORSE THAN THAT, UNFORTUNATELY, SINCE THE SIGNAL DOESN'T BEND MUCH AROUND THE EARTH'S CURVATURE. IT WOULD BE TRUE FOR DISTANCES OF 5 AND 10 MILES, RESPECTIVELY, SINCE THE EARTH'S CURVATURE DOESN'T COME INTO PLAY AT THOSE DISTANCES. (YOUR SOURCE IS ABOUT 1200 FT UP IN THE AIR.)

A PHENOMENON CALLED "DUCTING" WILL SOMETIMES TRUMP THE EARTH'S CURVATURE. TV SIGNALS CAN GET TRAPPED IN ATMOSPHERIC LAYERS AND BE RETURNED TO EARTH MUCH STRONGER THAN THE THEORY PREDICTS. DUCTS ARE MORE COMMON IN WARM AIR, SO FOOTBALL SEASON IN THE NORTHEAST IS NOT THE TIME TO BE HOPING FOR DUCTING.

FOR WHAT IT'S WORTH, WCBS-2 IS ALREADY SENDING OUT ITS DIGITAL SIGNAL IN ADVANCE OF NEXT FEBRUARY -- MOST STATIONS ARE DOING SO. WCBS IS ON CHANNEL 56 NOW AND WILL DROP TO 33 ON TRANSITION DAY. SEE http://rabbitears.info/market.php

IT IS CONCEIVABLE THAT A BIG UHF ANTENNA WOULD WORK FOR YOU. IT WORKS FOR ME, HERE IN SOUTHERN CALIFORNIA, BUT MY DISTANT TRANSMITTERS ARE ON A 6,000 FT MOUNTAINTOP, WHICH IS A SIGNIFICANT ADVANTAGE FOR ME.

ROFLOL
I did that at a technical seminar in a hotel once. I was pondering the ramifications of the training and didn't even look at the door. It wasn't until the only woman there rushed in (probably preoccupied as well) and plopped down and peed that it dawned on me that there was something very very wrong!

In any case, Art seems to have trouble articulating and I have completely lost touch with any sense he might have made somewhere in the great pile of this thread.

I get that even though a resonant dipole can be treated as if it were a lumped constant at times, it really isn't that. Do electrons fly back and forth down the pole and induce a magnetic field? Without flying off the ends? Yes but that is hard to make sense of because there should be no current flow in an open wire. A loop element maybe, but the resonant loop has the same current as the center fed dipole. Perhaps looking at the re-entrant cavity makes more sense.

John, the danger in using mc squared is that it has not stood the test
of time. I have difficulty with it as the motion of an observer
acheiving the speed of light seems like standing on a sand spar
waiting for the tide to come in. Same goes with Feynman diagrams
as it just replaces an unknown with another unknown! Are these both
emporers with no clothes surrounded by Lemmings?

Correction: Photons have no rest mass. "radiated" photons have the
properties of mass because they are affected by gravitation. Light can
be bent by large bodies of mass.

Here is a plot for WCBS-TV
http://www.tvfool.com/?option=com_wrapper&Itemid=80&q=call%3dWCBS-TV%26type%
3dA

Be optimistic. That plot is conservative and here's why:

I grew up on Long Island and we often got Philly stations on a simple attic
antenna. However, the plots for Philly stations do not show that can
happen.

Well, darn Art, those nuclear explosions, yanno', like the ones "we"
used to do in Nevada ... those flying particles, the heat, the light,
the radiation, the sand blast, the wind!, etc., it is hard enough to
keep track of all that c*rp flying about, at those speeds (not to
mention the amount of sun screen a guy needs just to be in vicinity!),
it is hard to arrive at an exact tally when, it is all over--yanno' what
I mean, Vern? ;-)

Oh sure, they have a "perceived mass", don't they?; I mean, we seem to be able to measure it, don't we? How do you know it "exists ALL ITS TRAVEL TIME", what makes you think it is not constantly oscillating for energy to mass ... and it is ONLY the average of that which we are REALLY measuring ... can you prove that, well, CAN YOU? Can you provide any relevant data here to prove it? Any URLs? Any quotes from famous physicists? Any psychics? Have you consulted Art? <again-innocent-smile>

But then, you ever try to run along side of one of those photons and measure it? I mean, this is how you really gain a critics respect (heck, you'd even gain acknowledgment from the arrl, well, most-likely--well, I think you would--IMHO anyway, etc.) -- now, the question to separate the men from the boys -- now, have you? <pleasant-innocent-smile>

Geesh! <looks-out-window>

Digital: No lock and no indication of trying to lock (which is provided on
some receivers)

Analog: Recognizable signal, possibly with sound, probably with no color
and so much snow as to be unwatchable.

For the analog experiance, I am relying on bench tests I did with a TV
servicing generator. For baseline, I advanced the RF amplitude just to the
point where I had a snow-free picture. Next, I added 10 dB attenuators and
noted the results with each addition.

One: observable snow, no big deal
Two: Objectionable snow, this ain't good
Three: horrible snow, I can't watch this.
Four: Is there even a picture?

I should have used black holes as my example. One only needs to accept
that black holes exist in order to believe that gravity affects the
property of mass inerent in light ;-)

Sal:

Forgive me, please; but, for a minute there, your words provided me with
a psychic vision ... <grin>

All these "youngsters" growing up around the internet and DVDs and MP3s,
expect perfect communications. Perhaps their homes did not even possess
a broadcast capable TV!

And, to them, the "quality of TV signal" we grew up with is horrifying,
indeed, too scary and mentally damaging to view!

Maybe it will just take them a bit of time to go through their denial
and be able to look upon such "ugly-ness" as a snowy picture with,
really, only usable audio as being "OK", and finally allow us to view
it? (I know, they will probably see us as being able to view childporn
in allowing such visual images to ACTUALLY enter our eyes! <DEEP-FROWN>
) <HUGE-chuckle, and a grin>

Perhaps then, they will finally allow such a digital signal though to
the circuitry? Ya' never know, ya' just never know ... <blank-stare>

Anyway ... this is a much more valid argument than that of an analog
signal EVER being more desirable to a digital one ...

Regards,
JS

Really?

Then your mind is so limited it doesn't realize that a black hole would warp the very fabric of space/time itself, and therefore the wave propagating though it, and therefore the wave would have to choice but purse a course towards it? ... yanno', I suspected just that thing!

No, they are generating a magnetic field when the current is at the
surface
which means eddy currents are also there. neither of these appear when
the current is enclosed

Without flying off the
> ends? Yes but that is hard to make sense of because there should be no
> current flow in an open wire.
The wire may be open but the current flow IS closed

 A loop element maybe, but the resonant loop
> has the same current as the center fed dipole. Perhaps looking at the
> re-entrant cavity makes more sense.

John you are equating resonance with equilibrium, a dipole in antenna
terms is a half wavelength
resonant but not in a state of equilibrium. Equilibrium is a staple in
this Universe. First comes equilibrium
after which you may consider resonance.......but not the reverse. Both
of the samples are of a half wave length thus it is not in
equilibrium.
Equilibrium comes first in the satisfaction analysis, if it fails all
falls apart.
Best regards

Art

Oh Tom! bound particles means a LARGE force binding particles
together.
Break them apart and you release a large amount of energy which you
cannot destroy.
With heavy water you have two bound particles, the particles
themselves are weak in energy.
But then you are trying to get away from the subject at hand in this
thread.
Want to start atomic stuff then start a thread and attract those who
are interested in that.
Think antennas and radiation
Art

OK, now, since 50MHz is being modulated, how much bandwidth will each
sideband occupy? Cannot be done, John. HF frequencies can only handle
insignificant amounts of data information making them useless in
today's digital age.

THAT is why (to answer the original question) nobody gives a damn
about small antennas on HF frequencies. The data we are transferring
today goes far beyond a simple 10KHz voice communication on a small
section of spectrum. Even a single analog TV channel occupies 5MHz
which I think would cover the entire HF spectrum if it were tried.
There are some exceptional HF digital applications which society can
find useful in extremely limited applications such as sail mail but
even that is quite disruptive due to the wide chunk of HF it occupies
for a single email transmission.

Frankly, I care greatly, immensely about small antennas -- I could not run a rig without a small/stealth antenna. Of course, your statement becomes quite true if you ignore all like me, the MW band, cell phones, personal computers, wifi, remote tire gauges, bluetooth, remote devices, gps, etc., etc., etc. (consider this an endless list, really!)

And, indeed the lengths you are prepared to go--the insane arguments you are prepared to argue, the insane stands you are prepared to defend ... well, you will excuse me from my responsibilities there ... I have prior appointments ... ROFLOL--AGAIN!

Brother, you are a joke, you will fit in well with some here ... I already got your name on that list ... even "the slow witted" will eventually deduce you--take care ... but then, you are fun to toy with.

Hi Joe,

The impact of this statement is that with the transmitter antenna that high, it can see to an horizon (edge of the viewable earth) that is 109 miles away. This is just the situation you need if your receive antenna was sitting on the ground. Unfortunately, the Empire State Building is not that tall (1200 feet or so), and it is effectively (from your point of view, literally) underground by that needed additional 4800 feet.

To make up the difference, you would lift that antenna off the ground, and try to raise it that same 4800 feet. Unlikely. A gain antenna will not make up for looking through 100 miles of mud and water.

On the flip side, if ducting is working (don't make a schedule based on this coinciding with your calendar), rabbit ears on your roof will do nicely. Myself, during the summer months in Colorado, I could get Edmonton and Calgary Canada - more than 1000 miles away. Getting them on separate occasions was more a surprise than a plan, however. But I did manage to get to see an entire movie before the duct collapsed.

A simple question that hasn't been addressed:
What do you see when you tune NYC stations?

That would be true if the casual observer did not consider truly empty space to be nothingness. I do. I do not believe that truly empty space is "something" because to believe otherwise would be to assume that nothingness only exists outside of our Universe... nothingness would not "be" but we define it, so it "is". We know that TEMs can propagate through truly empty space because TEM waves propagate through space, some of which must be "empty" space and some of which is "occupied". I agree that some locii of space, but not all, are characterized by a wide variety of quantum particles, perhaps only some of which actually occupy the space associated with them. Bottom line is that such particles are not required for TEM waves to propagate and they are not the aether.

```

The crux of the question concerned the physical makeup of the structure of the universe. Then you addressed the issues regarding entities which can or cannot exist inside ot outside the structure. The discussion on the makeup of the structure was never closed. You put the cart in front of the horse.

If the US had gone with the DVB-T COFDM standard, instead of the ATSC
8VSB standard, we would have much better immunity to reflections.

OFDM is fairly immune to reflections, which appears as frequency
selective fading. If a few carriers end up cancelling with a
reflection, then COFDM still has 1700 or more carriers that continue
to pass data. With FEC, most of the data gets through. Something
like this:

Yep, it's a problem. I have two working record players and some vinyl
left over from my mis-spent youth. When the kids complain about
assorted digital audio oddities, I play a 78 rpm record for them. The
usual reaction is "What that hiss" or maybe "did you really listen to
that"? A few of the older kids have seen VCR quality, which they seem
to tolerate. However, the same kids will go ballistic if there are
any artifacts on their shinny new HDTV screen, their MP3 player
trashes a tune, or their streaming audio/video skips a beat. We have
raise a generation of connoisseurs.

A very simple observation:

Give us one question you would expect to see.

Give us the answer that would be marked as passing.

Without both, this sappy sentiment of yours is nothing more than a
late night exercise of crying bitter tears into the pillow - and
leaving the window open so the neighbors can hear the sobs of regret.

Sorry about that. Don't you think it is odd that all computer programs
based on Maxwells laws reflect every thing I have stated? I am not a
computer freak
How I could make all this up and several computer programs made by
different
people both sides of the pond can reproduce without conivance a
computer program
that provides the details of every thing that I have stated?
None of this is in the antenna books or relavent books on science and
do you know why?
My generation has been taken over by computers where prior generations
resorted to origanal thought from first principles.
They accept that the computer will spill out a lot of inaplicable
information but feel the sorting problem

is so much easier for the lazy. Problem is that books on the sciences have not had critical analysis by the following generation which always call for revisions. The books used for supplying questions to the computer are those taken from the books that never received the normal generational
revisions. Sorting computer answers requires common sense but with the absence of required revisions what one calls common sense is one that needs revision ala garbage in garbage out. Now we get statements that if more gain came from tipping antennas the world would have tipped the towers
years ago. To me that is totally absent of common sence but for people who rely on unrevised books it is perfectly understandable. If people have discarded Universal laws then the computers will not reflect same based on input. We have to many academics churning out physics papers which reflects direction of past papers as a way of getting them accepted and published and a path to a higher station. What we need is design by first principles which other countries still have by not yet smitten by computers and who are capable of original thought.
Universities in the industrial world state the books that must be followedand the student realizes that the answer in the books are the datum used by professors so..... follow the same path formed by those that proceded you as the primary for getting a job is that piece of paper without original thought. There are many of past generations that have
generalized about point radiation alas this generations belittles it and successfully resist change. Sad Sad Sad

If you really want us "lesser mortals" to appreciate your thoughts ,
why don't you just put down your formulations in terms of concrete
mathematical equations and post it to a website or some place as a
document or something. That way we can see what you mean. In all of
these I assume that your thoughts are at least expressible in terms of
the known mathematics.
We would appreciate your endeavor and who knows it can lead to a new
form of mathematics with your pure and powerful thoughts.
And don't think that I am saying you are wrong outright because what
you have said as reaction forces, are involved in a local neighborhood
of the electron and the field associated with it. But they don't quite
manifest in a way that you say they does to the best of my knowledge.
Moreover it is not quite a practical idea to think of individual
electrons and the reaction associated with them when they are in all
probable states and with well practically innumerable number of
electrons.

In case you don't like to quantify your thoughts and put them into
practical formulations which can be solved in finite number of

steps.... well I am sorry we will never be enlightened. And prefer to look at an antenna the more conventional way. All these neglecting the fact that mechanics of particles at microscopic level deviates considerably from the macroscopic world formulations, the inclusion of which might make this thread more bitter.

You could lookup the exact quote for Newton's 3rd law.
<http://en.wikipedia.org/wiki/Newton%27s_laws_of_motion>
"Every action has an equal and opposite reaction."
Please note that the words "parity" and "on par" are not used anywhere
in the explanation and discussion. If you want to introduce new
physical principles, it would probably be best if you used more
conventional terminology suitable for the GUM (great unwashed masses).

>Parity is what I picked up on this newsgroup so when in Rome........
>Parity means the maintainance of balance
>still sounds O.K. but I will not use it any more!
>Art

Well, there are also online dictionaries. Try:
<http://www.google.com/search?hl=en&q=define%3A+parity>
None of the definitions for parity resemble whatever it is you're
trying to do, explain, or complain about.

Incidentally, the way you use Google as a dictionary is to inscribe:
define: parity
in the search box.

You also use the term equilibrium in a similar manner. Your use is
correct (to mean a type of balance) but you consistently fail to
adequately describe what is balancing against what else. Some people
may prefer your technobabble description, but if there's a balance,
there's also a corresponding equation which equates whatever it is
you're balancing. I like equations and numbers.

If you genuinely want to understand how antennas work based on first
principles, you might consider that all an antenna does is provide an
optimum transfer (match) of power between a transmitting device at
some impedance (usually 50 ohms) and the impedance of free space (377

ohms). Everything else in antenna design is controlling the direction
and efficiency of this power transfer.

Wow. I'm not retired yet, but I'm not worried. You would have no trouble running me out of town with your expertise on antennas. I'm still learning and probably will never be an expert. I read the NEC mailing list. I dabble with EzNEC and 4NEC2. I designm model, and build some rather odd microwave antennas. I have two antenna related

products to my name from about 20 years ago. Not quite an expert but sufficiently functional to hold my own:
<http://802.11junk.com/jeffl/antennas/>
Note: I did *NOT* design the commercial antennas shown.

>Find an expert for yourself and ask him the same questions that you
>ask of me.

I only asked one question. What do you mean by equalibrium and what is being balanced against what else. No expert or beginner could answer that. Only you can.

> My statements are nothing special and nor am I

Actually, your statements initially appeared quite special to me. I was serious when I asked what program you used to generate your rant. I couldn't believe that anyone intentionally wrote such a word salad. I suspected there was some software behind it. I even attempted to duplicate the feat by hand (and failed). Your statements are special to me for no better reason than I failed to mimick the style.

It appears that sentimentality rules the thread. Lacking any steps
taken by Art towards providing a question with its corresponding
answer must mean he couldn't pass the same test it might be placed in.

Barring Art's hesitancy to supply his own solution, I can only rummage
up a similar instance from him where we might make this a quality of
test a CBer might tackle that is drawn from patented (5,625,367)
technology:

Q. reflector element is usually tuned to a frequency slightly
higher than the driver resonant frequency - TRUE or FALSE?

Q. director elements are usually tuned to frequencies slightly
lower than the driver resonant frequency - TRUE or FALSE?

Thankfully, the PTO does not test nor issue licenses based upon this
technology source used as reference material.

I can well imagine how "equilibrium" would similarly pollute the
question pool and the lack of follow-up leaves us with the soap opera
it was always meant to be.

Who are these people and what programs are they using?
What results did they obtain?
Which NEC models were they using (NEC2, NEC4, etc)?

>None of this is in the antenna books or relavent books on science and
>do you know why?

Which antenna books are lacking? I have about 5 linear feet of
printed antenna books, several boxes of IEEE Antenna and Propagation
SIG proceedings, and much of my hard disk stuffed with free and
commercial modeling and design software. Which antenna books are you
suggesting are lacking and why?

>My generation has been taken over by computers where prior generations
>resorted to origanal thought from first principles.

Nice topic switch. I'm 60.8 years old and am also in the computer
business.
<http://802.11junk.com/jeffl/pics/office/>
I've never had an original thought in my life. I base everything I do
on what myself and others have done before. Short of divine
revelations, I suspect that much of the scientific and engineering
world works the same way. Everything is based somewhat on past
experience and history.

>They accept that the computer will spill out a lot of inaplicable
>information but feel the sorting problem
>is so much easier for the lazy.

I can see you've never actually used a computah to solve problems. I have. Computers are difficult to deal with for solving an individual problem. They are truly wonderful for solving repetitive and interactive problems. Simulations and emulations are fantastic for uncovering bugs and problems before they become too difficult or too expensive to fix. There are many companies that go directly from a computah model to manufacturing without a prototype because they are confident their computah models will work. If saving huge amounts of time and effort constitutes being lazy, you have a warped perspective of what computahs can do for you.

>Problem is that books on the sciences
>have not had critical analysis by the following generation which
>always call for revisions.

Nice topic switch again. Books tend to be several years behind.

Which technical antenna books are you suggesting have failed to obtain a peer review? I played tech editor on one Unix book (never again!) and have a fair idea of the process. There are many books published under various vanity press labels which are solely the responsibility of the author. Some of those, I will agree have not been extensively peer reviewed. I know of several in the ham radio market that have not been properly reviewed, but which are generally accurate.

Which antenna books do you find inadequate due to lack of a "critical analysis"?

>The books used for supplying questions to
>the computer are those taken from the books that never received the
>normal generational
>revisions.

My computer does not accept questions. We're not there yet. I have to frame the problem in a language that the computer can understand. The questions are implied in the framing of the problem.

There are books which only survive the first printing. Those will never survive a "normal generational revision" because there will be no 2nd generation.

Which antenna books do you find inadequate due to the lack of a 2nd printing?

>Sorting computer answers requires common sense

My computer does the sorting, not me. I do the interpretation of the results produced by the computer. My computer also lacks common sense. We're not there yet. It's also possible that I lack common sense, but I won't admit to that.

>but with the
>absence of required revisions what one calls common sense is one that
>needs revision ala garbage in garbage out.

Who or what organization requires a revision?

Where does common sense come into the design of an antenna? What equations govern the application of common sense in an antenna design? What are the units of measure of common sense?

>Now we get statements that
>if more gain came from tipping antennas the world would have tipped
>the towers
>years ago.

That's not common sense. It's designing within the limitations of the technology and within conventional construction practices. If you've ever had to deal with populating a tower full of assorted antennas and trying to optimize the arrangement for maximum revenue (more antennas), versus minimum interaction and intermod, you'll understand what practical limitations are all about. Anyone can design an antenna that works in free space. It takes some skill and experience to design it to meet regulatory and practical limitations.

>To me that is totally absent of common sence but for people
>who rely on unrevised books it is perfectly understandable.

Most authors include an email address to which you can send corrections and objections. Some of mine have appeared in the errata pages for at least one book. What antenna book is in need of revision because it discusses tilting antennas?

>If people
>have discarded Universal laws then the computers will not reflect same
>based on input.

What universal law? I don't recall seeing a Universal Law in my computer or software.

>We have to many academics churning out physics papers
>which reflects direction of past papers as a way of getting them
>accepted and published and a path to a higher station.

Well, yes... that's the way it works. You learn from the past and you build on it. Most of those papers consist of a summary of existing technology and understanding. They then add their own research. You can see that on everything from traffic laws to patents. Have you ever even read a single issue of IEEE Antennas and Propagation SIG proceedings?

>What we need is
>design by first principles which other countries still have by not yet
>smitten by computers and who are capable of original thought.

No need to go looking outside the industrialized world. I sometimes help at the local skool on senior projects. The students are required to build something to graduate. I have a difficult time keeping the ideas down to something that can be built in a few weeks of class. However, the imagination and creativity of some of these students is

well beyond what I would expect to see from a seasoned professional.
If you want originality, get it before it's squashed by the
responsibilities and realities of life.

>Universities in the industrial world state the books that must be
>followedand the student realizes that the answer in the books are the
>datum used by professors so.....

Really? Skool textbooks are rotated almost constantly. That's
allegedly to keep up to date, but really to squash the used book
market. I spent much of college career arguing with the professors,
much of which was over reality versus what's in the books. When the
instructors have a political agenda added to the mix, things get
really interesting. Incidentally, one has to understand the books,
before one can argue against them.

>follow the same path formed by
>those that proceded you as the primary for getting a job is that piece
>of paper without original thought.

There are those that are capable of original thinking and those that
simply become cogs in the system. I don't have time to expound on the
relative merits of each. If you want to see a small riot, get all the
independent thinkers together. They can never agree on anything. Are
you sure you want everyone to be an original thinker? I shudder at
what methinks will happen to something like the traffic laws.

>There are many of past generations
>that have
>generalized about point radiation alas this generations belittles it
>and successfully resist change.

Nice topic switch again. How many and which generations generalized
about point radiation? How have these generations "belittled" point
radiation? Do you know that it's actually called zero-point energy?
What does zero-point energy have to do with antennas? How are you
going to deal with the infinite energy density required to obtain
zero-point energy?
<http://en.wikipedia.org/wiki/Zero-point_energy>

Google to the rescue:
<http://asistm.duit.uwa.edu.au/synchrotron/downloads/pdfs/chapter11_7.pdf>

mr / mo = 1 / (1 - (v^2/c^2))^0.5

where:
mr = relativistic mass
mo = mass at rest
v = velocity of particle
c = speed-o-light = 186,000 miles/sec

For v = 167,700 miles/sec
mr/mo = 1/ (1 - (167,700^2 / 186,000^2))^0.5
mr/mo = 1/ 1 - 0.813^0.5 = 1/ (1 - 0.902) = 1/ 0.0984 = 10.2

So, the mass of the particle at 90% the speed-o-light is 10 times that
of the particle at rest. It doesn't matter what particle. Do I get a
gold star?

(Somebody please check my arithmetic as I forgot to eat dinner, it's
after midnight, my brain is mush, and my calculator battery is fading
fast).

Ummm... that wasn't Newton. No quantum effects in Newton's work. That
was Einstein's theory of special relativity. See gamma.

All wrong. No gold star for that mess. I just hate it when I click
"send" and only then discover my arithmetic error. Rev 1.0 follows:

mr / mo = 1 / (1 - (v^2/c^2))^0.5

where:
mr = relativistic mass
mo = mass at rest
v = velocity of particle
c = speed-o-light = 186,000 miles/sec

For v = 167,700 miles/sec
mr/mo = 1/ (1 - (167,700^2 / 186,000^2))^0.5
mr/mo = 1/ (1 - 0.813)^0.5 = 1/ (0.187)^0.5 = 1/ 0.432 = 2.31

So, the mass of the particle at 90% the speed-o-light is 2.3 times
that of the particle at rest. It doesn't matter what particle. Maybe
a silver star?

> you locate the side bands? (________ and ________)

If we interpret this as a signal occupying the spectrum from DC to 28 kHz, we need about 1800 bits/Hz. Mathematically, this isn't impossible, but according to the Shannon/Hartley theorem, we need an SNR of 2^1800, or more than 5400 dB. Assuming noise of -120 dBm, the signal has to 5250 dBW, og 10^525 W. Making detection circuitry work at this power level would be a challange, as it is the equivalent of more than 10^498 suns, 10^486 milky ways or 10^475 observable universes.

Make that "nothing with *rest* mass can travel at the
speed of light". From an earlier posting of mine:

"Photons have zero rest mass. Otherwise, they couldn't
travel at the speed of light."

Jeff:

I am top posting here, just because your post is so damn long, and I could NOT bring myself to cut any of it ...

Thanks for being candid with us. Yep, you are one of us alright. Yep, we have to use others past books, thoughts, knowledge, computer apps, papers, etc. ... it is just too much, it is inundating ... I mean, my home office here looks like yours! And, the wife is a "neat-freak" ... I tell you, I spend all my time looking for materials she has "organized" for me ... <smirk>

I hope you didn't come here for answers, I mean I can't speak for everyone here, but all I have is questions! And, if I ask something that doesn't have a black and white answer, I get slapped in the face! <blank-look>

Demands for answers, demands for open discussions, demands we look at even the quantum world in "explorations into antennas", especially from some of the STRONG personalities you find here, can be intimidating ... but, welcome aboard.

However, if you thought you would find peace of mind, bliss and enlightenment here ... think again. ROFLOL

You are just about to find out "how deep this Rabbit-Hole goes!"

Warm regards,
JS

Jeff:

Another good point, I avoid patents in my searches!

In the google search box, I always include the search terms "-patents"
and "-patent" (minus the double quotes) ... that is the type of stuff
(silly patents) which just accelerates my insane questions to
unfathomable limits!

Heck, I can't even tell the "silly" ones (patents) from the "real" ones
... indeed, I strongly suspect I am a poor one to judge!

LOL!

True, travel is something less than the speed of light
Art

-

In what medium? Remember that the speed of light is different in different
media.

I should have used black holes as my example. One only needs to accept
that black holes exist in order to believe that gravity affects the
property of mass inerent in light ;-)

-

Maybe it's not gravity that bends the light that comes near black holes.
Maybe it's something more sinister like extremely strong magnetic forces. .
. Maybe I just don't have the faith necessary to believe in black holes
(tongue firmly in cheek).

Mike
Einstein changed course in study because he could not solve the
description of the weak force
which I see as foucalt current. Knowing this Einstein would be proud
to stand up as state his
thoughts on Universal law has now been proved forget. You cannot
parcel laws based on a particular subject.
Universl laws are just that. UNIVERSAL. What on earth does parity mean
in the U.S.?
Art

-

The equal and opposite reaction thing applies to massive bodies and motion.
It's all different when talking about relativistic speeds for things such as
electromagnetic radiation.

Cecil:

That was what I got out of it ... but then, I focused on Arts' observation, "One thing is certain, Gauss states that static particles cannot radiate in free space as there is no exchange of flux ... "

And, obviously, IMHO, he is referring to a space truly "composed of nothing" and absent of anything even resembling an ether. And, I did accept that as the crux of his ponder-ings/point(s.)

However, also buried in his text are obvious references to a space such as the one our universe resides in ... So, once again, one of those arguments/debates which could go on forever ... and I got those prior appointments ... ;-)

Read it again! I didn't say photons have zero mass; I said electromagnetic
radiation (EMR) has no mass. EMR exhibits both wave and particle
properties. When travelling at the speed of light, it exhibits wave
properties.

Well, yeah, makes sense to me ... but then, apparently not others ...
not 100% sure, but yeah, that is where I am at, at the present time.

First that "sea" must fill the void to give us a "media" (ocean) to sail
... and most certainly a must for RF/light to propagate through!

Cecil, this sounds like a regular poster David.Perhaps he is pulling
your leg with his nonsence
Art

-

No. I'm not David; and I just started posting here. I'm not trying to pull
anyone's leg with nonsense. I'm trying to participate in a discussion where
people have different perceptions and understanding of physics. Isn't that
what causes us all to learn and/or change our perceptions on occassion? It
seems that the last vestage of a lack of answers to a point is to mount a
personal attack. Your refusal to answer the salient point and instead mount
a personal attack means your ability to listen is totally stopped.
Discussion over.

Maybe "absence of anything even resembling a structure"
would be a better way to put it. It's pretty clear that
if there is no structure for space, then space cannot
exist. Absolute nothing would necessarily be the absence
of any and every *thing* including space.

When traveling at the speed of light, it exhibits particle
properties. It has been about half a century since experiments
proved that light waves are bent by gravity thus proving that
electromagnetic radiation has mass. That idea was postulated
in 1915. Did you get your degree before then? :-)

OK So nobody wants to talk about equilibrium or current flow on a
radiator.
Thats fine by me. Took a lot of posts to get to that point. JB I
apologize
I have been nailed to the cross so many times I tend to bundle things
together.
When I started I zeroed on equilibrium as a start because existing
laws state that if a charge is moving on the outside of a radiator
then there is movement on the inside of a radiator Now that is not in
the books. Why is that? However discussion went away from the intent
of the thread. equilibrium with respect to radiation. O well another
try later
Regards
Art

Jeff
Let us straighten out a few things about me that most know
I am nowhere as clever or versatile in all the subjects that you
mentioned.
Frankly my present knoweledge is very limited.
I had a heart attack, 5 bypasses plus a loss in memory.So that I could
continue to live I chose radiation as a niche
study for recovery. Ofcourse I will never recover fully. So basically
I have tunnel vision built around the niche of radiation and antennas
where I went back to first principles and started with Newton
This process has lasted for several years, very slow progress but I
have got to a point that my thoughts on antennas and radiation is so
different from the books that I have to go back to the beginning with
respect tp Newton and re evaluate with my peers. Yes I am seen as an
idiot, very understandable but I am persistent in talking and
discussing the initial point in radiation .From Newtons laws I deduce
that current flow on a fractional wavelength antenna includes current
flow thru the centre of a radiator. I am going right back to my new
beginnings but the books do not say that! Soi I can't participate in
the many diversions from the niche I have taken and thus ask for a

similar focus from others. No sympathy or crying desired as I am comfortable and living a good life but even with tunnel vision I am determined to continue and participate in the route I have chosen as there is no alternative.
Sooooo after more than a thousand posts based on the initial radiator and equilibrium I have been unable to make one step forward in a re evaluation of my journey. But I will never give up so you will have to live with that. All of this is old hat to most of the posters who give me hell and sometimes I respond in kind to new posters in a like manner which is wrong but it happens. So to sum up I am a simple man with tunnel vision in a single subject and no where as knoweledgable as other posters outside my field of choice.
My very best regards
Art Unwin KB9MZ....xg

Static particles? Does he mean statically charged particles? They don't
radiate, they are attracted to opposite charged matter. But then there is
ionization of a substance.

Why must there be an "it" through which TEM waves proagate? Why cannot
they propagate through nothingness? Not all volumes of space are
necessarily occupied by any form of matter.

What would the velocity factor of whipped bananas be?

Hmm. Seems to move that the old wave/particle duality thing comes into play
in this instance. A wave has no mass, agreed? So, if we collapse the wave
function, the photon (a particle by popular concensus) loses its velocity,
which means, you guessed it, no mass.

So you are trying to tell me that if I completely evacuate a sealed glass jar it then contains space? That's like saying the absence of light is darkness. True as a conceptual description of nothingness. If you choose to rename nothingness, does that mean it aint nothin? You guys have too much time on your hands.

My following comments are totally off topic and are the mutterings of an old curmudgeon. You have been warned.

What the hell happened to the word "saw"? I seen this, or I seen that. Folks, that isn't correct. How can you get through four years of college without using the "saw", except for when referring to a woodworking tool?

It is - "I saw that". Not, "I seen that". For crying out loud!!! <G>

The photon mass math is trivial.

E= mc^2 = hf

m = hf/c^2 = h/(c)lamda

If I remember correctly, a photon cannot travel slower
than the speed of light.

But if nothingness is something (because it has a name) then you can propagate through it because even nothingness is something so that can be our "media". In fact it must be the perfect medium because it has a velocity factor of 1.

Nothingness that contains something is not nothing,
i.e. is an obvious logical contradiction. Every cubic
meter of the universe contains energy. Therefore,
nothingness cannot exist.

Not agreed. An EM wave possesses momentum per unit volume
from which the mass of the wave can be calculated.

A container of light has more mass than a similar
container that does not contain light.

EM waves certainly have mass that can bend a comet's
tail away from the sun.

Casimir effect experiments have been run in
a vacuum and proved there is lots of "stuff"
still there even in empty space. There is
no such thing as nothingness, at least not
within the space of our universe.

There is no "there" within the space of our universe
where nothing is there. Casimir effect experiments
have been run on spaces where nothing is supposed to
be. But instead of nothing, they found the quantum soup
which is the space occupied by our universe.

You have to look objectively at the advantages and disadvantages of both
unless your goal is to do away with the radio operator specifically, and

perhaps ham radio too. No license should be required at all to buy an "RF data box complete with antenna and battery" then all we would need to do is load our software and plug in the USB cable. If there aren't enough bars, then we would need to "DO SOMETHING STUPID" or wait until there are enough bars. Or just get bored and QSY to the Internet. I got it now... Viva la revolucion! Won't get fooled again. Perhaps if you do away with all the hams when you do away with ham radio, no one will remember how fun it was.

Well, yeah, that would pretty much be my call. Its' just a bit to "swallow." And, add to that the fact, we have never seen "nothing", but then probably never will ... LOL

I have been attempting to locate my exact old school physics text(s), have had no luck. But, if I remember correctly, my books only mentioned Einsteins first claim, that the structure/ether of space does not exist. Indeed, if I am remembering correctly, they lumped structure/ether together with alchemists, charlatans, magic, witches, etc. ...

Somewhere, later in college, I am suspecting, Einstein, this time reneging on that claim, was quoted again, this time allowing for the structure/ether:

Ether and the Theory of Relativity
Albert Einstein, an address delivered on May 5th, 1920, in the University of Leyden.

" ...
More careful reflection teaches us, however, that the special theory of relativity does not compel us to deny ether. We may assume the existence of an ether,; only we must give up ascribing a definite state of motion to it, i.e. we must by abstraction take from it the last mechanical characteristic which Lorentz had still left it. We shall see later that this point of view, the conceivability of which shall at once endeavour to make more intelligible by a somewhat halting comparison, is justified by the results of the general theory of relativity.
... "

His implication in the words, " ... we must by abstraction take from it the last mechanical characteristic ... ", implies the ether will, almost, be as difficult to "view" as "nothing." 8-)

LET ME POINT OUT, Einstein was NOT too intimidated to use that ugly word, "ether." ;-) This is supposed to be the exact text, translated, from his presentation. If someone knows of another which differs, please let me know ...

I don't know why that should be so difficult to ponder ... in the post to Cecil, above, note that Einstein takes "all" mechanical structure from the ether (but, I think Cecil is still correct--some "other" type of structure IS there.)

However, with "entangled particles", no "real" movement is necessary, one particle "imparts" its' behavior to another, that one to another and on and on ... why they preform this "dance" in our perceived form of a wave, or sine-wave even--I cannot fathom nor suggest a reason for ... but then, maybe something else is really happening ... their are theories which deal with this all ... the "particle dance" is/are just my thoughts on what "seems" to be occurring and "envisioned" from others works ... what space "really" is composed of ???, Art seems to suggest looking at the CERN project, I don't think we have a choice--if we wish to proceed in this quest ...

JB:

Please, just consider these few words, "You can't 'see' nothing! You can't go 'through nothing' (or, go to nothing)."

I know, it is too simple, one wonders how he missed the concept--nothing is just what it means--nothing!

You are "seeing something" when you look at space (and, I know, it IS hard to swallow--"time" brings ones' thinking into line on this, or, it worked for me ...)

Regards,
JS

Yes, exactly. As hard to believe as it is, once you evacuate that jar,
the structure of Cecils' and my ether still "drifts" in and out of that
jar like it does not even exist! (the jar that is)

And don't complain to me about that being "impossible", I already said
that and claimed that--long ago ... ROFLOL

This is my experience too. 36 db S/N gives you a decent picture, 55-60db
S/N gives you a good fade margin for analog and a perfect picture (if
convergence and purity are capable)

For digital, 30 db S/N gives you a "perfect" picture if it is 1080i, or no
better and maybe worse if it is only 480i but you still need at least 50 db
S/N for fade margin or everything will break up when there is a 5-20 db
fade. At least with the Analog signal, you will still have audio during
deep fades.

Smith makes sense in light of consumers who only complain about what they see. Most people won't be doing TV DXing. Tough luck for those who do. There is a real big point about all the extra connectors as the entertainment system grows. Lots of people needed to have someone hook it up for them, and now complain about having to punch too many buttons on too many remotes to get their picture and sound.

As a ham, I like to be able to do things the kids and consumers might not want to be bothered with. If only ARRL would consider this concept. Ham radio will never be a mainstream consumer product unless it ceases to be ham radio completely.

wrote:

>Ummm... that wasn't Newton. No quantum effects in Newton's work.

Hi Jeff,

167,770 miles/s is hardly quantum speed but it is achievable in
electrons and photons.

At last report
F = M ï¿½ A
was Newton's work among two other laws (something the trio can't
manage to compute). Art can't even manage parity here.

If the prospects of error due to Quantum effects appear to be ugly,
then any could have named a lower figure that is tolerable.
Unfortunately it would still require computation, and the outcome
would be those Newtonian Philosopherz would shy from an honest
scribbling on the blackboard as taking their precious gaze away from
their navels.

I'm not starting from zero, but it has been a number of years since I did
theoretical analysis.

When I google "equilibrium" and then start trying to filter the responses
down to things that are potentially "on topic", the references lead back to
you on this newsgroup.

Well, we've established you can't compute it for an electron,
certainly. And this speculation about a photon.... Do it for 167,770
miles/s then.

Naw, let's simply say you've done it (there will never be any actual
evidence of your work as we can all agree), and move on. So much for
practicing Newtonian Philosopherz.

I don't "ploink" your postings, I just don't read them because they
are run off the xerox with no obvious intellectual value added - this
last round fairly confirmed that.

Do you know that the sun puts out a lot of neutrons and other particles?
It's not the light that bends the comet's tail.

> >Art

Wayn everybody wants me to answer their questions and not address mine
so they took over the thread
So to clear the air I started at the very beginning a radiator in
equilibrium and what it presents to me.
It has nothing to do with any of the sciences presented by the
posters. In direct terms I have stated that current flows down the
center
of a radiator if it is of a fractional wave length. A very simple
statement which nobody wishes to address. Fine by me, the thread would
then have a single posting and the multitude can generate questions
and discussion about deep space or other topics of choice. Ofcourse I
am not knowledable in those areas and I would stand aside. I would
prefer however the discussion to at least start with equilibrium which
leads to why or why not it is correct that current can flow thru the
center of a conductor the answer of which is not in the books. Some
people prefer to read the last page of the book first.
I prefere to examine foundations before determining the merits of a
house.
Regards
Art

JB
If I called those particles Neutrinos all hell would break out again
as in the past
I am refering to the Gaussian law of statics without comment of how I
could see
things differently from Gauss. Some would like to state them with
reference to charge
some another way. The medium that I take is static particles very
simple and understood by all
but then an opening for an auguement about a correction required.
Go figure

And later it was postulated that space is curved by massive objects and
that light simply follows the curves.

The idea of epicycles was first postulated in the 6th century BC.
Therefore, what?

It is painfully obvious that Art will never offer the questions only he can sign off on. The other Newtonian Philosopherz are equally flummoxed.

As for others following this tempest in a teapot, Art has already answered the two TRUE/FALSE questions above:

Q. reflector element is usually tuned to a frequency slightly higher than the driver resonant frequency - TRUE!

Q. director elements are usually tuned to frequencies slightly lower than the driver resonant frequency - TRUE!

and thus fulfills my observation he couldn't pass a test he Authured.

Gad, the irony is thick and gooey sweet.

>zero rest mass.

Yep. Brain damage after midnight. I first read electron, due to the
preceding CRT example. I then read proton without my reading glasses.
This morning, it morphed into photon. My apologies and I promise
never to post anything after midnight, on an empty stomach, without
glasses, while still working in my palatial office, and on subjects I
know little.

However, the jury is still out if photons have mass. NASA and others
say no:
<http://imagine.gsfc.nasa.gov/docs/ask_astro/answers/960731.html>
<http://www.ccmr.cornell.edu/education/ask/index.html?quid=240>
However, photons do have momentum or:
p = m v
which yields a calculatable value for mass at light speed for a
measurable momentum (i.e. transfer of momentum due to light pressure).
It's stuff like this that make me which quantum effects should never
have been discovered.

Fire the photon torpedoes...

Cecil Why not say what one call nothing is a reaction to the pressure
of gravity to zero but only on the earths surface
Vacuum is a datum pressure on earth only whereas there are different
datums thruout the universe.
If one could determin the datum of the many datums there still is no
reason that pressure positive or negative has an overpowing
force on every posible content. A case in point is a particle that is
projected within the Earths boundary that exceeds the force of gravity
but still exists in terms of matter un affected by negative
gravitational forces. When the datum for perfect nothingness is
determined in terms of the four forces only then can we equate nothing
with energy contained by particles with no affinity to gravity. All
nonsence probably since no problem can be solved with missing entities
such as particles of resistive particles that have yet to be detected
or what can affect them. A vacuum is just a measure of pressure
nothing more and nothing less with the assumption that all has mass
and zero resistance to datum pressure of our Earth. Lookng at things
in a totally different manner
if there was a volume of nothing in our Universe would it not implode
to zero dimension with the understanding that external forces are in
existance to every point in the Universe
I supply this post purely to be part of the discussion that this
thread now represents without ever being present to conditions of
outer space and thus unable to respond in detail to those who have
intimate knoweledge of such via their interrestial travels where they
had the opportunity to touch to lift and touch with the toungue to
determine the characteristics of all. If I knew some shakesphere I
would enter the first act in detail and then compare that act with
something that would then be comparible to the three stuges which has
nothing to do with this thread if you get my gist. No names mentioned

ofcours but keep a watch to the rear! I have arrived in Rome
Best Regards
Art

Right. Black holes have high gravity. Gravity warps space. Light can
travel only through the boundaries of space, therefore light has mass.
No need to say space-time, "space" is sufficient. The discussion may
be quantum related but it is not relativistic.

One would first have to presume to know what space is in order to
stipulate the conditions for its existence. Ample amounts of
foolishness and arrogance would be required to make such a presumption.
On the other hand reasonable men speculate about what it might be.
The only thing we can be sure of is what it is _not_.

Not correct. It's not quite as simple as e = m*c**2. You must use the
Lorentz transformation.

Using the same values you have assiged to c and v, the correct
equation would be:

mr = mo/SQRT(1 - v**2/c**2)

As v => c, mr must => infinity (therefore no mass can reach c)

OK So nobody wants to talk about equilibrium or current flow on a radiator.
Thats fine by me. Took a lot of posts to get to that point. JB I apologize
I have been nailed to the cross so many times I tend to bundle things together.
When I started I zeroed on equilibrium as a start because existing laws state that if a charge is moving on the outside of a radiator then there is movement on the inside of a radiator Now that is not in the books. Why is that? However discussion went away from the intent of the thread. equilibrium with respect to radiation. O well another try later
Regards
Art

Consider that there is little difference in the performance of a solid radiator and hollow radiator.

There are things about Electromagnetic Radiation that aren't discussed by Newton. Study classical antenna theory, then you will be on common ground with others that study antennas. The danger of concentrating on your own line of study so much is that you wind up out on a limb. I see this often when dealing with different terminology spawned of different paradigms, where similar circuits are redrawn and renamed by different engineering teams. This is nowhere more evident in Psychology and Philosophy, where insight springs from the conclusions derived from the limited experiences of an isolated group or individual. It is like the blind men describing an elephant when they have only one part in front of them. They each call the elephant something else based on their singular experience and arrive at logical conclusions that are false. The fact that we only have one lifetime to devote to all the pieces is indeed a limitation.

Wayn e I stated that I started at the point of first principles which
is Newton and I went from there.
There is not a book that I know that starts there. You want a lst of
authors that physics examiners look for to determine

what"famous " people will side with him if he accepts it. That lesson is not lost on all that aspire to heights in the academic world so a paper MUST be buillt on the works of others whose work has been accepted. In my case I start at a point where the shoulders that I stand aupon are all dead. I made reference to Newton only and I havent got a list of supporters. So I start at the beginning with just one name in consideration to isolate the point of possible error. The ARRL infers the circuit is the capacitance to ground where as I put the cuircuit as going thru the center of the conductor.
I dont see the need to bring in quantum physics or to speculate about photons or massless items or how many gears that they can race thru to obtain
the speed of light. I was not an electrical engineer and I am not wired like Richard as I have a wife and I am a great grandpa and no wish to be any part of his world. My subject is and will always be until in someway I am satisfied is what is the electrical circuit of a fractional wavelength antenna which is not specifically stated in the books and where every poster is waiting for somnebody else to dip his toe in the water and thus avoid any subsequent
verbal thrashing. I can never point to a list of supporting evidence beyond Newton and his laws.
Best regards.....I have to cut an acre of grass with a hand mower as my daily excercise yes I do have a tractor but that is not excercise

From another of my postings: "If I remember correctly,
a photon cannot travel slower than the speed of light."

The first nine words in my first statement above are
not mine but were copied verbatim from Rectifier's posting
(except for the misspelled word). If there was an implication
that light can travel at less than the speed of light, it
didn't come from me.

They should have said "no rest mass" to keep the
uninitiated from getting confused. Any particle that
can apply pressure, possesses momentum and "penetrating
ability" at the least has relativistic mass.

http://math.ucr.edu/home/baez/physics/ParticleAndNuclear/photon_mass.html

"In special relativity, it turns out that we are still able to
define a particle's momentum p such that it behaves in well-
defined ways that are an extension of the Newtonian case.
Although p and v still point in the same direction, it turns
out that they are no longer proportional; the best we can
do is relate them via the particle's 'relativistic mass'."

"It is almost certainly impossible to do any experiment that
would establish the photon rest mass to be exactly zero."

It was postulated by Einstein in 1915 and measurements
agreed in 1919. It is said to have been proven a scientific
fact in 1959. I'm just surprised that your university didn't
teach it in the postulate stage, valid measurement stage, or
in the scientific fact stage. :-)

We know space exists and according to quantum physics,
nothing except particles exist. It doesn't take a
rocket scientist to conclude that, if quantum physics
is correct, then space must be constructed of particles
albeit possibly as yet undiscovered and possibly
unmeasurable particles.

Ok now yer giving me a headache by explaining an observation on theories based upon theories base upon theories. In the Casimir experiments, there are plates or shapes deliberately placed in the vacuum.

Quantum theory goes too far into the theoretical for my taste. It is a curious mental and mathematical exercise but it reminds me of Leibnitz' Monad theory of existence. It doesn't help me with antenna performance. Go there without me.

Are you proposing that a photon cannot travel slower than the speed of
light in a vacuum, or it cannot travel slower than the speed of light
in water or the speed of light through glass or air? Please reference
which speed of light a photon cannot travel slower than. Assuming your
answer is the universal constrant "c", then my question is, knowing
that light travels faster through a vacuum than it does through water,
is the light travelling through water still "photons" or is that
impossible because they are travelling too slow? What are they then?
Please advise. Thanks.

True under some abstract (non-physical) conditions. For example, the "structure" could be a mere figment of your imagination which is something, an abstraction, a figment. However, it is not something which measureable TEM waves could use as an aether for propagation. The answer lies in the fact that, if TEM waves are present, then something (the TEM WAVE itself) is present where nothing existed before. TEM waves need only by their very presence propagagate through nothing. This does not suggest I am stating that they travel outside the boundaries of the Universe which you believe is the only locus where nothing exists, and to which I disagree since empty space is also "nothing" as defined in this universe. Empty space,in locii where the exotic paricles do not exist, needs no structure. It is that without structure.

You cut off the first line of my post, "Do you know that the sun puts out a lot of neutrons and other particles?" I didn't say the sun puts out nothing except EM waves.

Light travels at different speeds in different media, such as water, glass,
etc.

Could well be but I have no alternative and am going my own way. Why
should this disturb others?
They could easily show me the error of my ways instead of taking up
the cause against change
We all know Newtons Laws (some interprete in different ways) So we
have a radiator upon which a charge rests
there for ethere is no need for a opposing vector inside the radiator.
Then we have a radiator that is not in equilibrium and thus we have a
vector
which according to the laws of Newton or equilibrium or what ever
requires a responding vector inside the conductor. Inside the

conductor there is no magnetic field nor the Foucalt current thus it is not radiating just spending copper losses. Put the apparatus in a vacuum and the current will take a less resistive route by producing an arc at the ends AWAY from the radiator. To me that sounds as perfect logic but there is no book that states it or the presence of the Foucalt current. That is not to say there are not a lot of explanations all of which are different so I go back to first principles and people get angry at the idea of change. Now the tide on this post has turned around on Cecil. Let me warn you that Cecil has outlasted this group several times to the tune of threads extending more than a thousand more than a few times over the last 20 years. One person who harasses him tries a lot of tactics on him including pointing out that his only difference he has with a dog is lipstickl but only the newbies respond to him unnowingly. Cecil will out last them all.

In any random medium, a photon cannot travel slower
than the speed of light through that medium. In
particular, photons associated with standing waves
do NOT stand still.

In direct terms I have stated that current flows down the
center
of a radiator if it is of a fractional wave length. A very simple
statement which nobody wishes to address. Fine by me, the thread would
then have a single posting and the multitude can generate questions
and discussion about deep space or other topics of choice.

Severns, QEX, Nov/Dec 2000, pp 20-29 does address the issue.
On page 22: "At some points within the wire, the instantaneous current is
actually flowing backwards (minus signs) due to the self-induced
eddy currents that are the underlying phenomena responsible for skin
effect."
These results were verified with Ansoft's "Maxwell" FEM software.
An excellent treatment of the math can be found at:
http://www.g3ynh.info/zdocs/comps/zint.html

OK, you must be talking about an AC current as there is a wavelength involved. But if you are implying there is current in the center matching the amplitude of the current on the surface you are wrong.

See this link
http://en.wikipedia.org/wiki/Skin_depth

Note the phrase regarding current;"the magnitude of which is greatest at the conductor's surface". This is where the current is.

There is also this statement "the current can be flowing in the opposite direction to that at the surface." Note that there are qualifications on that statement (on the page referenced).

So, while there can be some current flowing inside the conductor, it does not say it is a matching current in the other direction. By saying most of the current is at the surface, it conflicts with your statement.

> A very simple
> statement which nobody wishes to address.

You are trying to apply "For a force there is always an equal and opposite reaction: or the forces of two bodies on each other are always equal and are directed in opposite directions."
(from "http://en.wikipedia.org/wiki/Newton%27s_laws_of_motion")

You make a simple statement, brought about but applying a concept incorrectly. I don't think Newton said anything about electricity and flow in conductors. Newton's law doesn't say what the opposing force is, so I don't think you can say it is anything specific.

<snip>

> I would
> prefer however the discussion to at least start with equilibrium which

The right books would tell you that AC current does not flow in the center of a conductor.

As others have stated, you need to clearly define what _you_ mean by equilibrium.

> Some
> people prefer to read the last page of the book first.
> I prefere to examine foundations before determining the merits of a
> house.

Those foundations need to take into account all the considerations, not just the ones you know or want to talk about. You may have read some of the book, but you skipped quite a few chapters.

> Regards
> Art

Consider your statement to have been addressed.

You will note that both links include some math. This is something you don't provide with your explanations. If you went through the rigor to work out the math and present it to the group with sufficient clarity you might get someone to believe you. If you want someone to believe you, it is up to you to effectively communicate your ideas.

It is hard to tell if you have a useful concept regarding antennas, are completely lost, or just a troll.

But, just in case you have something, then...

Many antennas are built using tubing for light weight. So, if there is a current flowing in the middle, it is good that the ends of the tubes are crimped, or plugged. I wouldn't want the flowing electrons spilling out onto my lawn.

I know books say a lot of things but do they explain WHY current
cannot flow thru the center?
Somebody said the current flow backwards now that is hard to
understand unles he is refering to a tank circuit
where the antenna has capacitance at one end and inductance at the
other and the current goes nowhere.
I think I will sit back and see what the experts say and if the IEEE
has accepted al these explanations.
One thing I particularly have difficulty with is that the secondary
current can overcome the primary current
where the power flows back to a wall plug or something like that.
Another infers that current travel in a aluminum tube is different to

the flow of a solid conductor presumably with double the surface area you have double the amount of radiation. The next publication from the ARRL is going to rock the science world with these findings on radiation. Funny thing is that based on my findings I designed an antenna which computer program AO Pro
determined was quite good, an arrangement that is if the program doesn;'t follow the teachings of the books should I then throw the program away?
NEC4 models the antenna that is in equilibrium also isn't that a bummer? If only somebody would come up with a vector diagram of a radiator that was NOT in equilibrium I could locate my fault very quickly. Still if all of what has been described will be published in the ARRL and IEEE papers I can afford to wait.
Thank you all
Art

Yeah, well, if you take a cubic centimeter of "energy" around yourself, of even myself, for that matter, it better be at rest! Otherwise, the motion/time thing, which your simplistic equation ignores, will, MOST CERTAINLY, come into play ...

However, the equation you gave is good ... but just NOT that simple for REAL world situations ... but then, I stated that, before you gave the equation ...

You have argued this yourself, most vehemently, with photons ... think about it ... an argument I actually agreed with, and echo here ... motion DOES change things, a bit ... and, it is VERY DIFFICULT to keey energized particles at rest, but then, not impossible ;-)

I read that last one Frank but I think it is aimed at computer geeks
which I am not.
Pleased to see eddy currents are the underlying phenomina responsible
for skin depth
presumably he explains how the secondary current can overcome that
which creats it.
At last we have a source for free energy

My gawd that is a LOT of text for a simple point! Do you have any schooling at all? But then, there is a "velocity factor" and this is the property of the media "it" travels ... And, the velocity of light, or RF, though a media, is differing, yes ...And, I have nothing to add on photons speed thought any material ... indeed ... photons and waves are very much in debate here ... but then, if you are/were awake, you already "know" that ...

Anyway, the short answer, think "velocity factor" and yes, "they" do travel MUCH slower than the speed of light ...

And, actually, your question seems one posed by a complete idiot ... but then, you DON'T REALIZE THAT, DO YOU?

Anyway, good luck in all your pursuits ... ;-)

Regards,
JS

Jim
If I drew a vacuum on a bottle on earth and then let the black hole
apply its forces upon the innards of the bottle
would it extract any thing more than the operation on earth? I kinda
look at the black hole as the datum level of maximum force
as a reaction to the big bang and that datum is not the same as that
on earth. Thus a vacuum on earth is not a perfect vacuum in terrestial
form. Quite a quandry for me when determining what nothing is and when
a implosion would occur. Frankly Jim I don't feel what nothing is can
be answered
Very best regards
Art

Please show me the reference that proves empty is not nothing and I
will prove by definition of the word empty that empty is not
something. This is true even in the 21st centruy.

What about Cerenkov radiation? In this case, beta particles with mass
travel faster than light in a water medium. So much for 'nothing can
travel faster than a photon'. It depends on the medium. If the medium
is a vacuum, then yes, nothing can travel faster than the speed of
light in that medium. Need to be careful. I have to Credit R. Clark
for pointinmg this out some time ago. See http://nuclear.mst.edu/research/reactor.html

Not sure if you got the correct site Art, since there should be nothing
concerning computers at: http://www.g3ynh.info/zdocs/comps/zint.html.
Also the excellent references at:
http://www.g3ynh.info/zdocs/comps/refs.html
Note that the central current in the conductor is significantly less than
than the surface current. Solution of the Kelvin functions should
be easy with Mathcad, or similar, providing only the first few
terms of the series are considered. Direct computation of
these modified Bessel functions is limited to the latest versions of
Mathcad,
since the earlier versions cannot handle complex arguments.
A more rigorous treatment can be found at the following:
http://mathworld.wolfram.com/KelvinFunctions.html
http://mathworld.wolfram.com/Bei.html
http://mathworld.wolfram.com/Ber.html
Where, even with Mathcad 7, using the 20, or so, first terms of the series
expansions, I have gotten good agreement with the published curves.
Mathcad certainly does not like the upper limits of the series to
be infinity. Probably even Excel could handle it.

If you do the differential equations, it doesn't say why the center can't so much as why the skin does. Similar to gravitation and water flowing downhill vs uphill. I'll go into detail if you can't figure it out. Or not.

I think what he means and hasn't said is "Nothing can be truly empty".
Period. No matter what you do.

Although extracting energy through the Casimir effect can cause a very
small space to have lower that normal foam in it. It's due to very
short spacing constraining the longest wavelength allowed in between the
plates. Which is not really different than the normal ways things
temporarily can change entropy in a volume.

>equation would be:
>
>mr = mo/SQRT(1 - v**2/c**2)

That's exactly the same equation I used but with different notation.
It's still the square root:
SQRT(whatever) = (whatever)^0.5

Is there a standard notation or style for arithmetic and
exponentiation for usenet posting? I've been switching around using
different styles almost at random over the years.

I also divided both sides of the equation by mo to get the ratio of
relativistic mass to the at rest mass.

>As v => c, mr must => infinity (therefore no mass can reach c)

Yep.
Go FTL (faster than light), and you get a cosmic speeding ticket.

I am not familiar with AO Pro, but usually NEC based programs
will compute an average gain test, which helps determine the
validity of the model. Pushing the limits of the program concerning
conductor proximity, length to diameter ratio, etc. can produce
erroneous results.

>NEC4 models the antenna that is in equilibrium also isn't that a

NEC 4, and 2, for that matter, use a "Thin wire approximation" which
assumes current only exists at the surface of the wire, has only axial
components, and the surface current is uniform around the wire.

>Frankly my present knoweledge is very limited.

Then learn. Antenna design and modeling is not easy. Just
understanding Maxwell's Equations is enough to keep you busy for a few
months. Antenna modeling (I suggest using 4NEC2) will keep you busy
for another few months. Trying to reconcile theory, models, and
reality will burn a few more months. However, when you're done, you
will understand something about antennas and how they work.
<http://home.ict.nl/~arivoors/>

Personally, I judge people by their willingness and ability to learn.
That's what distinguished modern technological humans from a inanimate
rock.

>I had a heart attack, 5 bypasses plus a loss in memory.

In 2002, I just barely missed having a heart attack. I nearly passed
out during the treadmill test. I celebrated the event with a triple
bypass, which effectively rolled back my biological clock about 10
years. Best thing I ever did. No memory loss except from the
anaesthetics used during surgery. Incidentally, I'm now 60.8 years
old. Kinda sounds like you also had a stroke. You're lucky to be
alive. My father had a stroke in 1986 and did not do very well
afterwards.

>So that I could
>continue to live I chose radiation as a niche
>study for recovery.

Fine, but I question the methods you call "study". It's considered
good form to gather your evidence first, and then supply your
conclusions, not the reverse order.

>Of course I will never recover fully.

Neither will I. I'm still collecting medical problems. Man was meant
to live for about 25 years. Anything beyond that is a free ride.

>So basically
>I have tunnel vision built around the niche of radiation and antennas

>different from the books that I have to go back to the beginning with

>respect tp Newton and re evaluate with my peers.

Radio and antennas are built of physics. However, it's not Newtonian physics, but electrodynamics as in Maxwell's Equations. Have you studied those? They're quite different from Newton's equations, which a sometimes called "classical mechanics". (Note: It's not easy. Just decoding the notation is a major challenge).
<http://en.wikipedia.org/wiki/Maxwell's_equations>

>Yes I am seen as an
>idiot, very understandable but I am persistent in talking and
>discussing the initial point in radiation .

You make an attempt at understanding. An idiot doesn't even try.

>From Newtons laws I deduce
>that current flow on a fractional wavelength antenna includes current
>flow thru the centre of a radiator.

Which of Newton's laws? What equations or thought experiment resulted in this deduction? How do you reconcile your conclusion with the common assumption that RF current flows on the outside of a conductor?

>I am going right back to my new
>beginnings but the books do not say that!

For good reason. You're wrong and your unspecified books are correct.

>So I can't participate in
>the many diversions from the niche I have taken and thus ask for a
>similar focus from others.

Yes you can. You can take it one step at a time. No need to jump directly from Newton to skin effect. Just walk me through your logic.

>No sympathy or crying desired as I am
>comfortable and living a good life but even with tunnel vision I am
>determined to continue and participate in the route I have chosen as
>there is no alternative.

By contrast, I'm willing to throw out everything I have learned and presume to be correct, if any of it can be proven or demonstrated wrong. I hold absolutely nothing (except my bank balance) as sacred, and consider everything subject to suspicion and debate. If you are permanently attached to your pet theory, you effectively refuse to accept input or criticism. Therefore, you have stopped learning and are starting to resemble the previously mentioned inanimate rock.

For example, did you know that the direction one counts causes the final count to vary? A simple example is counting the number of fingers on both hands. Start from one end counting 1,2,3,4,5,6... and ending in 10, which appears to be the correct count. Yet counting fingers downward results in 10, 9, 8, 7, 6, plus 5 more makes 11. Surprise, you have 11 fingers. Like I said, nothing is sacred.

>Sooooo after more than a thousand posts based on the initial radiator

Try again...would you believe light as 38 miles per hour?
<http://www.hno.harvard.edu/gazette/1999/02.18/light.html>
or at near absolute zero, coming to a complete stop?
<http://www.wired.com/science/discoveries/magazine/15-11/st_alphageek>
or used in optoelectronics?
<http://news.zdnet.com/2100-9584_22-145405.html>
or even faster then 3*10^8 meters/sec?
<http://www.scienceblog.com/light.html>

Quiz: How fast do the electrons flow in a copper conductor?
Hint: It's not the speed of light.
Cheat: <http://en.wikipedia.org/wiki/Electric_current>

A vector diagram that shows a charge at rest on the surface of a
radiator which shows that there is no opposing vector at the center.
Then we have a radiator that is not in equilibrium. In that case i
would place a vector on the surface and another vector at the center.
Thus charges are in motion both on the outside and the inside of the
radiator.I base this on the reasoning that the inner resistance is
less
than 377 where an arc is produced at the ends. the idea that the
leading edge of current flow will reverse at the radiator ends and
oppose the trailing current is just beyond my thinking as you do not
have a closed circuit. I have not seen an illustration that shows
current that reverses upon itself in a open circuit.

I did not research your reason for making the statement. However,
there is a commonly accepted derivation of a skin effect calculation
that makes frequency inversely proportional to skin depth. There is
nothing about the fraction of the wavelength that occupies the
conductor length. Can you provide a technical cite? Thanks.

Sure they do. Look under "skin effect".
<http://en.wikipedia.org/wiki/Skin_effect>
The components of the fields generated by AC conduction tend to repell
each other, causing them to drift towards the points of maximum
seperation, which is the outside of the conductor.

What is the frequency of the currents flowing backwards? If the same
as forward current (which it would be), then that and a few other
attributes such as conductor size, resistivity and mu, I can give you
skin depth by simple subtraction of the forward/reverse current
vectors. However, it will not necessarily indicate indicate that some/
no current flows in the center....it depends on the above variables.
At lower frequencies, a certain proportion of the current distribution
may occupy the center if the conductor is thin enough.

No Im not going that direction. Visulise a salvage yard that use
magnetic
fields on a conveyor which produces a collision of magnetic fields
which
levitates artucles made of aluminum such that it falls in a selected
container
the ejection being created by the foucault or eddy current.
Now look at that same conveyor belt as a antenna or radiator upon
which particles are at rest.I easily can visualise
the same action as a replica of a antenna with particles at rest since
Gaussian law of statics when extended equals maxwells law
Thus equilibrium and the presence of particles I take as a given. Also

by viewing the Gaussian field one can determine that a radiator
can be any size shape or elevation as long as the arrangement in
equilibrium. This points away from planar designs as well as the final
arrangement must not posses external lumped loads as maxwell provides
no place for them. In a way I am working backwards that render the
eddy force as the weak force
of the four forces of the standard model. Placing a verticle antenna
in a computor program without leaning it to a planar design and the
resulting radiator
shows the angle and magnitude of the "weak" force according to
Maxwells laws upon which the program is founded. This weak force is
thus appearing as the pitch of a helix antenna which confirmes the
reasoning against straight planar antennas. As far as how the static
particle obtained its own magnetic field I assume that exposure to the
earths magnetic field left a residue of thst immersion which is the
other field on the conveyor belt. Since the ejection of the partical
must be of a straight line projection the combination of the two
magnetic fields will provide that spin and where the reaction to the
ejection creates a vivration on the radiator as with the human ear
bone with the reverse acting on the receiving antenna. The particle
chose diamagnetic material to rest upon because as an free electron it
will not be absorbed in the matrix of other materials. Now that is in
laymans language based upon the salvage actions in use today as well
as non destructive material measurements which appear to be a
duplicate of the antenna function. Yes it is a woven dialogue but it
does duplicate functions in use that are not theoretical and for me
matches perfectly. I don't see how I can explain my thoughts any
better to avoid
the implication that it is all blabber since to me it explaind
radiation in detail where it does not appear as a mystery.
unfortunately hams will not follow in detail my reasoningas emotion
rules their responses and where they then introduce other areas of
science that was not present in the initial reasoning
and thus make me an easy mark for derision. So stick with my reasoning
and break it apart piece by piece scientifically to show my resoning
produces
an impossibility. I might add that nobody accepts that the addition of
a radiator and a time varying field produces a dynamic field which
mathematically
reflects Maxwells laws which if they are correct tears my reasoning
apart . I know it is very hard to follow and leaving many places to
laugh at.
I also placed a helix antenna in euilibrium and without external
lumped loads which produces a pattern of gun shot form whigch again I
expected with a gain of around 10dbi. Go figure

Could well be but I have no alternative and am going my own way. Why
should this disturb others?
They could easily show me the error of my ways instead of taking up
the cause against change
We all know Newtons Laws (some interprete in different ways) So we
have a radiator upon which a charge rests
there for ethere is no need for a opposing vector inside the radiator.

Then we have a radiator that is not in equilibrium and thus we have a vector
which according to the laws of Newton or equilibrium or what ever requires a responding vector inside the conductor. Inside the conductor there is no magnetic field nor the Foucalt current thus it is not radiating just spending copper losses. Put the apparatus in a vacuum and the current will take a less resistive route by producing an arc at the ends AWAY from the radiator. To me that sounds as perfect logic but there is no book that states it or the presence of the Foucalt current. That is not to say there are not a lot of explanations all of which are different so I go back to first principles and people get angry at the idea of change. Now the tide on this post has turned around on Cecil. Let me warn you that Cecil has outlasted this group several times to the tune of threads extending more than a thousand more than a few times over the last 20 years. One person who harasses him tries a lot of tactics on him including pointing out that his only difference he has with a dog is lipstickl but only the newbies respond to him unnowingly. Cecil will out last them all.
Art Back to the mowing

--Well Art, there are some people out there that tend to boasting and jump on any opportunity.

No, there is no arcing at the end of the elements. The ends of a center fed dipole are a high impedance so there is high voltage there but as long as there are clean decent insulators there should be no trouble with that. With VERY HIGH power, ionization may take place and there will be a glow off the ends. The cubical Quad antenna was developed to combat that problem. It utilizes a full wave loop fed directly. Look also to the folded dipole. Find out though that the current in the loop is the same in that there will be a high voltage node at the points 1/4 wave away from the feedpoint even though the wire goes continuously around and back. Certainly if you touched it there, you would fry yourself by being a path to ground just as you would with a classic dipole.

These things are known and proven, unlike the quantum physics tangent the thread went off on. It is possible that Quantum Physics is all true. But it is really just a construct to explain certain realities that aren't fully explained with other theories. This should tell you that there is a better explanation out there but we don't have all the pieces. It is certainly an avenue of research. It could just as well be something else entirely where all the questions are answered even better. Quantum physics isn't needed to build antennas. Good luck in your studies. There is a lot of misunderstanding about antennas. And you might have confusion about parts that the writer considered evident. Concepts that I have found burdensome, I tend to place into a box for later, more in-depth study and chose not to trust them or myself with hard conclusions, especially if practical experience won't support them.

When traveling through a medium other than a vacuum
they do travel MUCH slower than the speed of light
in a vacuum but they travel at exactly the speed
of light *in the medium*, i.e. the photons don't
know that they have slowed down. :-)

An interesting question. Assuming a perfect vacuum
and the entire bottle outside of the event horizon
of the stationary black hole, would the black hole
ever eat the bottle? I suspect the black hole would
collapse space inside the bottle on its way to eating
the bottle.

If you chose to use colloquial English, you have to
live (or die) by fuzzy unscientific definitions. The
definition for "empty" that I have been using here is
"absolute nothing", i.e. no space and not even the
structure of space is there. I defined my use of the
word "empty" days ago. It is the same as a *literal*
interpretation of the definition from Websters's:

"empty - 1. containing nothing", i.e. literally

"empty - containing absolutely nothing including space"

I did not mean to imply I would explain the diff eqs. That would currently be a lost cause on you, because I am sure that I couldn't put it in "layman's terms" - you need the math to understand it. I meant that I would explain why the 2 situations were similar, or not explain, depending upon my mood.

To understand the situation, I would suggest that you start down the calculus road. The internet has to have tutorials on it. Differential equations look terribly obtuse, but they are an obtainable destination down that road if you choose to follow it.

The word was not misspelled. According to dictionary.com, which quotes the American Heritage Dictionary, "traveling" and "travelling" are both accepted ways of spelling the word.

Also, I never meant to assert that light can travel at less than the speed of light. I took modern physics in college and understand the concepts of relativity, although it's been 20 years; so I may get some terminology wrong or not be able to explain it as well as I could before. However, discussions like these are interesting and stimulate thought and a desire to go back and review the subject.

So a large part of the visible tail of the comet would
still point away from the sun even if the sun emitted
nothing but EM waves. EM waves possess momentum, apply
radiation pressure to dust particles (matter), and have
relativistic mass.

I can see the "spirit" you said that in, however, that statement could not be further from the truth ... "it" (or "those" theories and "ponderings"--space-structure/ether) is the whole reason why a signal gets from point a to point b ...

We cannot know if there are possibly better ways to manipulate this/these mediums, or if it is possible to design antennas "better" to manipulate "it", until we know what "it" is ... barring "dumb luck" and someone just "stumbles" onto some antenna which shows some improvement, somehow.

But yes; build something from present-day data/technology, it looks as if all this is going to take a bit before we know.

My take on that is a bit different ... on "AMATEUR Radio" that is.

In building antennas, tank ciruits, etc., I very seldom whip out a programmable scientific calculator and delve into the depths of the maths which allow them to preform/function/"work."

A few times, I have just grabbed up some tubing/wire a variable condenser or two, and "eyeballed" the construction--past experience provided "ballpark" figures/placements/wiring, testing, trimming and adjusting got me the final result ...

Mainly, I point this out so as not to "obsfucate" that layman, or discourage him ... the men who first started/awakened my interest in such things never gave any indication, to me, they had an understanding of calculus, only basic-math/algebra, and of course, geometry!

Indeed, at least one passed away without ever expressing any real interest in learning it!

However, in Arts pursuits, an understanding would be a real advantage ...

Well, to split hairs, electrons don't emit or absorb photons. The
energy or momentum from or to a photon is absorbed or emitted and
photons are either destroyed or created in the interaction in descrete
quanta levels. However, unless I heat my copper wire to
incandescence, it's is not going to emit or absorb any photons. I
just wanted to point out that the speed of propagation through a
medium is not the same as the speed of the particles involved in
conduction.

I've always suspected that some hams hated math and other technical subjects. While it is conceivable that you could build a ham antenna without using math, I don't think the results would be optimal. There are also those that advocate converting ham radio from a technical hobby, to a sport, where the technical aspects are diminished to the point of extinction, and the operational exercises of contesting, DX, CW, and rag chewing are predominant. No math required. Perhaps the FCC could balkanize the ham bands into technical and non-technical sub-bands, where the clueless and those that still design, calculate, and build their own equipment can be seperated for their own safety.

My understanding was about molecular alignment and that the flow of electrons would be there first. Notice that stranded wire is often preferred for it's current handling ability even though solid is easier to terminate to and doesn't have the problem of discontinuities due to corrosion on many surfaces that rub together.

This doesn't mean that eddy currents aren't there in hollow elements. Solid or stranded or hollow tubing, the eddy currents contribute to loss but don't contribute to radiation.

Ejection of particles should lead to deterioration of the metal but if you were to coat the elements (with non-conductive and non-reactive coating) there would be no deterioration. It would also prevent rain static.

I don't burden myself with paradigms to explain electromagnetic wave propagation in free space. It and Gravity do very well without my explanation. We know that the AC current in the antenna induces an electromagnetic wave is sufficient for my purpose. Unless I can find funding for renewed efforts... (wink nudge)

Well I disagree with you Quito was using a radiator that was not in a
state of equilibriun ie a half wave
format. As I have said earlier without equilibrium shows the charge in
movement which requires a complimentary movement
With the higher altitude Quito provided an alternative to placing the
vector inside the conductor and the circuit took a different route.
This was solved by using a full wave circuit in equilibrium that
removed the arcing choice by suppling a continous route on the outside
of the radiator.
If the quad was divided into two bent dipoles it would still arc at
the extremities because of the lower external pressure.
Really this is a good example of the necessity of equilibrium in
vector form where for equilibrium the circuit must be long enough or
multiples there of to provide the allowance of repeatability of
current flow ie. equal to the PERIOD length of the time varient
frequency . I stated multiples because it reflects the movement of a
pendulum where the occillation calcullation(formular) is the same as
the oscillation applied to a radiator when in resonance.
Thus the logic has evolved back to the starting point ala the
arbitrary border used by Gauss.
I slept to 11 oc this morning but it was not because of you I did to
much mowing and there is still some left. If I just used the tractor I
would surely die
Best regards
Art

And what do you do when they don't work? Cut-n-try is a rather
expensive way to build something that works. Given infinite time and
materials, it will eventually result in a functional antenna. You
could probably do that at HF frequencies where construction errors are
about equal to calculation errors. However, don't try it at microwave
frequencies. While it's possible to cut-n-try various microwave
structures, it's messy, difficult, prone to error, and not very
effective. The techniques used to build a coat hanger ground plane at
VHF just are not going to work at X-band.

The only way to get it close to right the first time is to calculate
first, calculate again, have someone check the calculations, drink
some wine, and check your calcs again. Then build it.

Yep. That will work at HF because the lower frequencies allow for
much larger construction errors. Your antenna lengths could be off
many cm and still work. Your xmitter can also tolerate a substantial
VSWR and still be considered functional and useful. You match box
could be grossly inefficient trying to match your constructed antenna,
and work well enough. Now, try that at microwave frequencies, where
every milliwatt is precious, where VSWR is too crude and reflection
coefficient comes close to describing the ultimate goal of a perfect
match, and where cm errors are disastrous. Some broadband antennas
(helix and horn) are very forgiving and can be build fairly crudely.
Others (stripline, phased arrays, cavity backed antennas, etc) have a
higher Q and require more accuracy than the eyeball can provide.

Same here. My original mentors were operators first and technical
types last. However, I saw the light (and the distinction) between

amateur and professional when I went to college and saw that radio things were easier and better if they were calculated (and understood) first. I have several humorous examples of hams operating in a professional environment (engineering lab at a radio manufactory) and failing miserably using cut-n-try methods popularized by ham radio.

>Indeed, at least one passed away without ever expressing any real
>interest in learning it!

There are suspicions that math may hasten one's demise. Perhaps he tried to do a calculation before he died?

>However, in Arts pursuits, an understanding would be a real advantage ...

Agreed. Once he gets that understanding, he can work on the communications problem. Perhaps publish his works. After solving all that, he can possibly consider the applications and implementations. The twisted road towards technical nirvana is littered with the wreckage of failed great ideas.

Incidentally, I was also going to bash your suggestion of ignoring patents. Might as well add that to my rant.
